Re-accredited by NAAC with 'A' Grade with CGPA 3.62/4  
Ranked 95 in College Category - 2021 under NIRF, Ministry of Education, Government of India  
Recognised as Centre for Research Capacity Building under UGC-STRIDE Scheme  
Recognized under DBT - BUILDER Scheme, Government of India  
College with "STAR STATUS" Conferred by DBT, Government of India  
Recognised by UGC as "College with Potential for Excellence"

Date: 12-08-2021

## NOTIFICATION

Sub: Syllabus of **M.Sc. Analytical Chemistry** under Choice Based Credit System.

Ref: 1. Decision of the Academic Council meeting held on 19-06-2021 vide

Agenda No: 20 (2) (2021-22)

2. Office Notification dated 12-08-2021

Pursuant to the above, the Syllabus of **M.Sc. Analytical Chemistry** under Choice Based Credit System which was approved by the Academic Council at its meeting held on 19-06-2021 is hereby notified for implementation with effect from the academic year **2021-22**.

Principal

Registrar

To:

1. The Chairman/Dean/HOD.
2. The Registrar Office
3. Library
4. PG Office

**PREAMBLE:**

St. Aloysius College established in 1880 as a minority institution is managed by the Jesuit Fathers of Mangalore Educational Society (MJES). The college was conferred autonomy from the academic year 2007-08. The Department of Chemistry, a pioneer in Chemistry education in the district, aims at building total personality of the student transforming young boys and girls into men and women for others, having compassion concern and commitment to the society. The proposed M.Sc. Course in analytical chemistry is an added commitment to the cause of higher education with an aim of serving the community. The course was started under the affiliation of Mangalore University and now is brought under Autonomy. Hence though the same syllabus has been retained with minor modifications, structural changes are incorporated to suit the credit system under autonomy. The Department of Chemistry has already eight PhD qualified faculty.

**OBJECTIVES:**

- To provide knowledge and skills in the field of analytical chemistry
- To generate manpower trained in analytical chemistry to meet the need of industry and academia.
- To train students to pursue research in the field of chemistry.
- To impart training in laboratory skills.
- To develop the personality of an individual by giving them the necessary skills.
- To offer 100% placement assistance.

**SCOPE OF THE COURSE:**

M.Sc. in analytical chemistry is a specialized post graduate course with job opportunities in industry. The Research and Development section of every industry requires personnel who are trained in handling various instruments. The course structure and curriculum is designed to enable the students to develop analytical and creative abilities which are very much needed by the industry. The Course is definitely at par with M.Sc. general Chemistry, M.Sc. Organic chemistry, M.Sc. Medicinal Chemistry etc.

**COURSE INTAKE:**

The maximum number of students to be admitted to the course is 30 each year.

## **ELIGIBILITY**

- Candidates would have studied any branch of Physical or biological science with chemistry as one of the major / optional subject in the under graduate level
- Not less than 45%(40% in case of SC/ST students) marks in the aggregate excluding languages in the under graduate level.
- The students should have studied physics and Mathematics at the higher secondary level.

## **SYLLABUS**

- The course will be conducted in accordance to the semester system
- Each semester consists of 20 weeks inclusive of examinations.
- All examinations including practical/ project/viva will conclude by the end of the 20th week.
- A candidate should secure overall a minimum 40% marks in each paper, including both internal assessment and end semester examination.
- A minimum of 35 % in each paper of end semester examination
- 75% attendance is the minimum requirement for appearing for the semester examinations

## **EVALUATION SYSTEM**

- The evaluation system of the course is based on two components. (i) Continuous evaluation (ii) End semester Examination.
- Continuous Evaluation: Based on this Internal assessment marks are allotted. It includes the following criterion-
- 50% marks for two internal assessment examination- Two examinations of 1 hour 30 minutes duration each carrying 50 marks in each semester are conducted. Total marks secured are reduced to 25.
- 3 marks are given for class participation.
- 7 marks are allotted for class seminar and 5 marks for quiz
- Ten marks for writing assignments and reviews.
- In the practicals of the first and second semester, one model examination is conducted for 40 marks and 10 marks for the viva. The marks are reduced to 25, continuous evaluation is done for

12 marks, 10 marks for class records and 3 marks for class participation. These marks are reduced to 15.

- In the practicals of the third and fourth semester, one model examination is conducted for 40 marks and 10 marks for viva. The marks are reduced to 25, continuous evaluation is done for 12 marks, 10 marks for class records and 3 marks for class participation. These marks are reduced to 30

#### **END SEMESTER EXAMINATION**

- Each end semester examination is conducted out of 70 marks. End semester examination question paper consists of questions to assess the conceptual, comprehensive and analytical abilities of the students.
- In all four semesters end semester practical exam is conducted in 50 marks (40 marks for practical proper and 10 marks for the viva) and the marks are reduced to 35.

#### **THEORY QUESTION PAPERS PATTERN**

- The Syllabus of each paper shall be grouped into units of 14 teaching Hours.
- All hard core papers will have 4 units. Soft core and open elective papers will have 3 units.
- Question Papers in all the four semesters shall consist of Parts A and B.
- For hard core papers - Part A shall contain eight (8) very short answer objective type questions carrying 2 marks each drawn from all the four units of the syllabus (2 questions per unit). Five (5) questions are to be answered.
- Part B shall contain eight (8) brief and/or long answer questions carrying 12 marks each drawn from all the four units of the syllabus (2 questions per unit).
- For soft core and open electives Part A shall contain 9 very short answer objective type questions carrying 2 marks each drawn from all the three units of the syllabus (3 questions per unit). Seven (7) questions are to be answered.
- Part B shall contain six (6) brief and/or long answer questions carrying 14 marks each drawn from all the three units of the syllabus (2 questions per unit).

- There may be a maximum of four sub-divisions per question, carrying 3 or more marks per sub-division. Five (5) out of eight (8) questions for hard core while 4 out of 6 questions for soft core and Open electives are to be answered choosing at least one question from each unit.

### **PROJECT WORK**

- The project work shall be carried out in the last semester for 75 Hours.
- Can be carried out either in the institution or in an Approved Industry or in both.
- To be carried out under the supervision of a teacher and submit a project report.
- Experts from the industries may also be involved in the project work as co-guides and in the evaluation of project reports.

### **Evaluation**

Project will be evaluated for hundred marks which includes presentation of the project

**NOTE:** The First, Second and Third Semesters of the course involve theory and practical, while the IV Semester involves theory, practical and project work. The project work shall be carried out

in the fourth semester for 75 Hours. After the Second Semester of the course, the project work could be carried out either in the institution or in an Approved Industry or in both. This should be under the supervision of a teacher and the project report should be submitted. Experts from the industries may also be involved in the project work as co-guides and in the evaluation of project reports.

**MAIN FEATURES OF THE COURSE:**

**M.Sc. Analytical chemistry has the following features.**

❖ The entire course will have a total of 2500 marks with 92 credits distributed in 4 semesters. Out of 92 credits, hard core has 50 credits (54.34%), Soft core has 36 credits (39.12%), Open elective has 6 credits (6.54%)

First semester	650	Marks	24	credits
Second semester	650	Marks	24	credits
Third semester	600	Marks	22	credits
Fourth semester	<u>600</u>	Marks	<u>22</u>	credits
	2500	Marks	92	credits

## FIRST SEMESTER

### PH 541.1: INORGANIC CHEMISTRY

#### Course Outcome:

Student will be able to:

- **Explain the chemistry of acids, bases, non-aqueous solvents and** the concepts of hard and soft acids and bases
- Describe the types of bonds and molecular shape of compounds with emphasis on VSEPR, VB and MO theory of complexes.
- **Discuss the properties of the non-transition elements like C, B and Si and their frameworks**
- Illustrate the properties and justify the anomalies of Nitrogen, Phosphorus, Sulphur and noble gas compounds.

#### UNIT I :

14 hours

*Electronic configuration of atoms, Auf Bau principle, Pauli's exclusion principle, Hund's rule, Slater's rule of the determination of screening constants. Trends in atomic & ionic radii, IP & EA along the period,*

**Hydrogen bond:** types and detection. Intermolecular Forces: Ion-dipole, dipole dipole, ion-induced dipole, dipole-induced dipole interactions and London forces.

**Ionic bond:** Properties of ionic substances, coordination number of an ion, structures of crystal lattices- NaCl, CsCl, ZnS and Rutile. Lattice energy- Born Lande equation, Born-Haber cycle, Uses of Born-Haber type of calculations. Ionic radii, methods of determining ionic radii, factors affecting ionic radii, radius ratio rule, covalent character in ionic bonds.

**Covalent bond:** valence bond theory, formal charge, resonance, hybridization, Bent's rules and energetics of hybridization, Deduction of molecular shapes – VSEPR theory, MO theory, application to homo ( $F_2$  and  $N_2$ ) and hetero diatomic (CO) and triatomic molecules ( $BeH_2$  and nitrite ion).

#### UNIT II :

14 hours

*Review of acid- base concepts: Arrhenius theory, Bronsted-Lowry theory, Lewis theory, General properties of solvents. Classification of solvents. Factors justifying the need of Non Aqueous solution Chemistry and failure of water as a Solvent.*

**Acids and Bases:** Measures of acid-base strength, Factors affecting strengths of hydracids, oxoacids and Lewis acids and bases, Drago -Wayland equation for Lewis acid- base interactions. hard & soft acid-bases, Lux-Flood, Usanovich & solvent system definition of acids and bases, solvent leveling effect, HSAB concepts, Symbiosis. Super acids - Hammett acidity function, Superacids based on arsenic and antimony

**Non-aqueous solvents :** Molten salts as solvents, ionic liquids, liquid  $NH_3$  and liquid  $SO_2$  as solvents, reactions in liq  $NH_3$  & liq  $SO_2$ , anhydrous  $H_2SO_4$ , glacial acetic acid as solvents, anhydrous HF, liquid sulphur dioxide

**UNIT III :****14 hours**

*Diagonal relationship between Boron & Silicon. Similarities in properties of Boron and Silicon.*

**Chemistry of higher boranes:** Classification, types of bonds in higher boranes- the styx number, structures and M.O. description of bonding, framework electron counting, Wade's rules, chemistry of  $B_5H_9$ ,  $B_{10}H_{14}$  and  $B_nH_n^{2-}$ .

**Carboranes :** Classification, Wade's rules, nomenclature, structures of  $CB_5H_9$ ,  $C_2B_4H_8$ ,  $C_3B_3H_7$  and  $C_4B_2H_6$ .

**Borazines :** Preparation, properties, structure. Difference in chemical properties between borazine and benzene, borazine derivatives (N & B substituted). Preparation of boron nitride.

**Silicates :** Classification, structure – Pyroxenes & amphiboles, Silicones, & zeolites.

**UNIT IV :****14 hours**

*Allotropes of nitrogen and sulphur, electronic configuration of N, P, S . Properties of inert gases and their oxidation states.*

Hydrides, oxides and oxyacids of nitrogen, phosphorous, sulphur & halogens.

**Phosphazenes-** Classification, Cyclophosphazenes- $(NPCl_2)_3$  and  $(NPCl_2)_4^{+}$  preparation and structure, Linear polyphosphazenes- preparation and applications, phosphazene polymers. Sulphur-nitrogen compounds- Preparation and structures of  $S_4N_4$  and  $S_2N_2$ ,  $(SN)_x$

**Condensed phosphates** – linear polyphosphates, long chain polyphosphates and metaphosphates  
Inter halogens, pseudohalogens, polyhalide ions, oxyhalogen species.

**Noble gas compounds :** Xenon oxides and fluorides. Preparation, properties and structures.

## PH 542.1 : ORGANIC CHEMISTRY

### Course Outcome:

Student will be able to:

- Explain the basic concepts of organic chemistry and the forces of attraction between different molecules.
- Explain the reaction intermediates and mechanisms.
- Demonstrate the importance of conformation and stereochemistry in understanding the reactivity and stability of organic molecules
- Detail the synthesis and stereochemistry of carbohydrates

### UNIT I

14 Hours

*Types of bonding, reactions (specify types), Bonds weaker than covalent: Hydrogen bonds types and applications, intermolecular forces; ion-dipole, dipole-dipole ion induced dipole, dipole-induced dipole interactions and London forces.*

**Nature of Bonding in Organic Molecules:** Localized and delocalized bonding, Conjugation, cross conjugation, resonance, hyper-conjugation and tautomerism and inductive effects. Aromaticity in benzenoid and non-benzenoid molecules, Huckel rule, alternant and non-alternant hydrocarbons, Homo-aromatic and anti-aromatic systems. Annulenes and hetero-annulenes. Physical methods to study aromaticity-UV, IR &  $^1\text{H}$  NMR. Addition compounds, Crown ether complexes and Cryptands inclusion compounds, cyclodextrins, Catenanes, rotaxanes and bonding in Fullerenes

**Acids and Bases :** organic acids and bases, pKa and pH, effect of solvent on acid and base strength, effect of structure of organic compound on acid and base strength, relative strengths of acids and bases based on inductive, mesomeric and steric effects.

### UNIT II

14 Hours

*Homolytic and heterolytic fission, carbanions and carbocations free radicals, relative stability.*

**Reaction Intermediates:** Generation, structure, stability, reactivity and detection of classical and non-classical, carbenes, nitrenes and arynes(with at least two reactions for each type of intermediates). Structure and stability of Ylides and enamines.

**Methods of Determining Reaction Mechanism:** Identification of products, detection of intermediates, isotopic labeling, stereochemical evidences, cross-over experiments, kinetic evidences and kinetic isotopic effects.

### UNIT III:

14 Hours

**Stereochemistry** *Elements of symmetry, Chiral centres, chirality, Chiral molecules, Optical isomerism of lactic acid and tartaric acids.*

**Optical Isomerism:** Conformation and configuration of molecules, projection formulae, Ball & Stick and Barton Models, Fischer, Saw-horse, Newmann and Flying wedge representations. Absolute configuration (D,L) and (R,S) systems. Molecules with more than one chiral centre, threo and erythro isomers, methods of resolution, stereo specific and stereo selective synthesis,

asymmetric synthesis, Cram's and Prelog's rules. Optical activity in the absence of chiral carbon-biphenyls, allenes and spiranes. Stereochemistry of compounds containing nitrogen, sulphur and phosphorus. Conformational analysis of cycloalkanes and decalins. Effect of conformation on reactivity.

**Geometrical Isomerism:** Cis-trans isomerism resulting from double bonds, monocyclic compounds and fused ring systems. E Z-notations, determination of configuration of geometrical isomers, syn and anti-isomers

#### UNIT IV:

14 Hours

**Carbohydrates:** Structural elucidation of fructose, Configuration and conformation of monosaccharide, Chemistry of important derivatives of monosaccharide-ethers, esters, acetals, ketals, deoxysugars, amino sugars. Structures of cellulose, chitin, starch, glycogen, heparin and chondritin.

**Organic Name Reactions:** Reactions, Mechanisms and synthetic uses of the following: Stobbe condensation, Darzen condensation, Gattermann-Koch reaction, Cannizzaro reaction, Duff reaction Chichibabin reaction, Benzoin condensation, Claisen-Schmidt condensation, Claisen reaction, Simon-Smith reaction, Stork Enamine reactions, Sharpless asymmetric epoxidation, Hofmann-Löffler-Freytag reaction, Woodward and Prevost Hydroxylation, Bucherer reaction, Ullmann reaction. Wittig reaction-Mitsunobu reaction, Stephen reaction.

## PH 543.1: PHYSICAL CHEMISTRY

### Course Outcome:

Student will be able to:

- Understand the basic concepts of thermodynamics and its applications.
- Recollect the basics and understand fundamental ideas of chemical kinetics and its applications
- Familiarize with the various concepts in heterogeneous catalysis.
- Study and apply the principle and applications of electrochemistry

### UNIT – I :

**14 hours**

*Concept of Entropy, Enthalpy and Free energy (Gibb's and Helmholtz). A brief resume of laws of thermodynamics (combined form of 1st and 2nd laws), entropy as a measure of unavailable energy.*

**Chemical Thermodynamics:** Concept of fugacity and free energy, entropy and free energy changes and spontaneity of processes. Variation of free energy with T & P, Maxwell's relations, thermodynamics equations of state, limitations of Van't Hoff's equation, Nernst heat theorem & its applications. Third law of thermodynamics, determination of third law of entropies.

**Application of thermodynamics:** Entropy and free energy of mixing, partial molar quantities, partial molar volume and free energy (chemical potential), their significance and determinations. Gibbs-Duhem and Duhem-Margules equations.

Thermodynamics of non-ideal solutions -Activity, activity coefficient-standard states.

Thermodynamics of ideal solutions - deductions of laws of Raoult's ebullioscopy, cryoscopy and osmotic pressure.

### UNIT - II:

**14 hours**

*Rate of a reaction – definition, rate equations of simple chemical reactions, order of a reaction – definitions and units.*

**Chemical kinetics:** Complex reactions- parallel, consecutive and reversible reactions. Branched chain reactions-general rate expression, explosion limits. Photochemical (hydrogen-halogen reactions) and oscillatory reactions.

**Reactions in solution:** Ionic reactions- salt and solvent effects. Substituent effects on the rates of reactions-Hammett and Taft equations.

**Theories of reaction rates:** Collision theory, activated complex theory and its applications to reactions in solution. Lindemann's theory of unimolecular reactions, Hinshelwood treatment, Study of fast reactions. Flow method, Flash photolysis

### UNIT-III

**14 hours**

*Homogeneous and heterogeneous catalysis, review of adsorption terms, Industrial application of catalysts.*

**Catalysis:** Homogeneous catalysis-equilibrium and steady state treatments, activation energies of catalysed reactions. Acid-base catalysis (general and specific), protolytic and prototropic

mechanisms, catalytic activity and acid strength measurements. Kinetics of enzyme catalysed reactions-Michaelis-Menten equation. Effect of pH, temperature & inhibitors

**Surface reaction kinetics:** A review of adsorption isotherms, uni- and bi-molecular reactions. Multilayer adsorption-BET equation-its derivation and application in surface area determination. Harkin`s–Jura equation and its application. Adsorption from solution, Gibbs adsorption, Desorption and heterogeneous catalysis – catalytic activity at surfaces, semiconductor catalysis, n-&p-type. Mechanism of surface reactions.

#### UNIT-IV

14 hours

*Conductivity, equivalent and molar conductivity and their variation with dilution for weak and strong electrolytes*

**Electrochemistry of solutions:** Nernst equation, Kohlrausch law of independent migration of ions. Activities in electrolytic solutions, mean activity coefficient Ionic atmosphere, Debye-Huckel-Onsager equation of conductivity and its validity. Walden`s rule and its application. Conductance minima, Concept of Ionic strength, Debye-Huckel limiting law (DHL), modifications to DHL-Types, qualitative tests and verification of DHL. Bjerrum theory of ion association-triple ion and significance.

**Phase Rule:** Concepts of phase rule, Application to two component system-simple eutectic system-Ag/Pb system and Zn/ Cd system. Three component systems, water-chloroform- acetic acid system, triangular plots.

## PS 544.1 : PRINCIPLES OF ANALYTICAL CHEMISTRY & SEPARATION TECHNIQUES

### Course Outcome:

Student will be able to:

- Imbibe knowledge about various sampling techniques and errors.
- Evoke the fundamental concepts of different titration techniques
- Understand the principle of different chromatography techniques and apply that knowledge for the separation and purification of various samples

### UNIT- I:

14 hours

*Types of errors- Determinate and indeterminate errors. Accuracy and precision. Introduction to gravimetric analysis*

Distribution of random errors- frequency distribution, the normal error curve. Statistical treatment of finite samples. Measures of central tendency- mean, median, mode, range, average deviation, relative average deviation, standard deviation and variance. Student's t test, confidence interval of the mean. Testing for significance, comparison of two means and two standard deviations. Criteria for rejection of an observation-Q test. Principles of sampling- The sampling steps. Methods for sampling solid, liquid and gaseous samples. Effects of sampling uncertainties. Sampling hazards.

**Gravimetry:** Precipitation methods, the colloidal state, Super saturation and precipitate formation., purity of the precipitate: co-precipitation, post-precipitation, Conditions for precipitation, precipitation from homogeneous solution, washing the precipitate. Fractional precipitation, organic precipitants.

### UNIT-II

14 hours

*Stability of complexes, stepwise and overall stability constant*

**Acid base titrations:** Titration curves for strong acid-strong base, weak acid-strong base and weak base-strong acid titrations. Polyprotic acids, poly equivalent bases. Determining the equivalence point-theory of acid-base indicator, colour change range of indicator, selection of proper indicator. Typical applications of acid-base titrations.

**Redox titrations:** Equilibrium constants for redox reactions - electrode potentials in equilibrium systems, calculation of equilibrium constants. Redox titration curves- formal potentials, derivation of titration curves. Factors affecting the shape of titration curves- concentration, completeness of reaction. Titration of mixtures- feasibility of redox titrations. Detections of end point -redox indicators, theory, specific and non specific indicators, choice of indicator, potentiometric end point detection. Karl Fischer reagent for water determination. Applications

**Complexometric titrations:** Complex formation reactions, chelating agents. EDTA-acidic properties, complexes with metal ions, equilibrium calculations involving EDTA, conditional formation constants, derivation of EDTA titration curves, effect of other complexing agents, factors affecting the shape of titration curves. Completeness of reaction, indicators for EDTA titrations, theory of common indicators. Titration methods employing EDTA-direct, back and displacement titrations, indirect determinations. Titration of mixtures, selectivity, masking and demasking agents, Typical applications of EDTA titrations- magnesium, manganese and zinc in a mixture. Titrations involving unidentate ligands-titration of chloride with  $Hg^{2+}$  and cyanide with  $Ag^+$ .

**UNIT III:****14 hours**

*Basic Concepts - General description, Classification of chromatographic methods. R<sub>f</sub> value and factors affecting R<sub>f</sub> values.*

**Solvent Extraction:** Definition, types, principle and efficiency of extraction. Sequence of extraction process. Factors affecting extraction-pH, oxidation state, modifiers, synergistic, masking and salting out agents. Techniques-batch and continuous extraction, Application.

**Column Chromatography - High Pressure Liquid Chromatography (HPLC):** Principle, instrumentation Apparatus, pumps, types of columns, packing and characteristics of liquid chromatographic detectors-UV, IR detectors. Advantages and applications, LC-MS.

**Ion-exchange Chromatography (IEC):** Synthesis and types of ion-exchange resins. Principle, factors affecting ion-exchange equilibria. Resin properties- ion-exchange capacity Applications of IEC in preparative, purification and recovery processes.

**Gas Chromatography (GC):** Principle, comparison of GSC and GLC. Instrumentation, Columns-packed and tubular. Study of detectors- thermal conductivity, flame ionization, electron capture, GC-MS. Factors affecting separation, applications.

## PS 545.1 BIO-ORGANIC CHEMISTRY

### Course Outcome:

Student will be able to:

- Understand the chemical principles of living cells, the biomolecules and biocatalytic reactions.
- Study the basic principles underlying the chemistry of nucleic acids.
- Explain the structure determination, synthesis and classification of biomolecules like vitamins and lipids

### UNIT I :

14 Hours

*Classification of amino acids based on structure, nature and biological importance. Properties such as isoelectric point, zwitter ion nature and amphoteric nature.*

**Amino acids and peptides:** Introduction and synthesis of amino acids, structure and conformation of peptide bond, N-terminal, C-terminal. Determination of peptides, enzymic cleavage of peptides, reagents for selective cleavage of polypeptide bonds. **Peptide synthesis:** Solution phase and Merrifield's solid phase synthesis, solution phase synthesis of oxytocin and vasopressin.

**Proteins:** Classification, structural determination: Primary, secondary, tertiary and quaternary. Stereochemistry of peptide chains, chemical bond involved in protein structure. Protein configuration:  $\alpha$ -helix, amino acids effecting  $\alpha$ -helix, rigid and planar peptide bond, Ramachandran plot,  $\beta$  pleated sheets, structure of silk fibroin, random coil structure of proteins, triple helical structure of collagen, similarity in 3D structure of haemoglobin and Myoglobin.

### UNIT II :

14 Hours

*Types of nucleic acids, differences between DNA & RNA both in structure and biological functions*

**Nucleic acids :** Introduction, nucleosides and nucleotides, structure of nucleoside, chemical synthesis of nucleoside- Adenosine, Guanosine(purine nucleosides), structure of nucleotide, synthesis of nucleotide(AMP). DNA(Watson-Crick model of double stranded DNA) and RNA. Functions of nucleic acids : Replication, transcription, translation, protein synthesis, flow of genetic information, genetic code.

### UNIT III :

14 Hours

*Introduction, classification and nomenclature- source and deficiency diseases-biological functions of vitamins*

**Vitamins:** Study of following vitamins: Vitamin A<sub>1</sub>& A<sub>2</sub>, Vitamin B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>&B<sub>12</sub>, Vitamin C, Vitamin D<sub>2</sub>& D<sub>3</sub>, Vitamin K<sub>1</sub>& K<sub>2</sub>, pantothenic acid, folic acid.

**Lipids :** Introduction, classification of lipids, synthesis of fatty acids. Compound lipids- Phospholipids, Glyco, spingo lipids and derivatives.

## PS 546.1 RESEARCH METHODOLOGY

### Course Outcome

Student will be able to:

**Evaluate Research output with philosophical base and greater relevance to the society**

**Identify the parameters of Quality research with scientific methodology**

**Understand the concepts Original Research, ethical guidelines and practices in conducting the research and publication of papers.**

**Create awareness on Intellectual property Rights and Patents.**

### Unit 1: Foundation of Research and Research Methodology: 14 Hours

Research – meaning, characteristics, objectives, motivation in research, need and importance of research. Types of Research; Philosophy and Research Philosophy – Ontology, Epistemology, Axiology, positivism, critical realism, interpretivism, post modernism, pragmatism – meaning, relevance and assumptions. Concept of Theory and Theory Building – deduction, induction and abduction. Research Strategies - meaning and types.

Research Problem – meaning, selecting the problem, sources of problem, statement of a problem;

Review of Literature – meaning and need for literature review, sources of literature review, reporting the review of literature, identification of research gap; Print : Sources of information – Primary, Secondary, Tertiary sources – Journals – Journal abbreviations – Abstracts – Current titles – Reviews – Monographs – Dictionaries – Textbooks – Current contents – Introduction to Chemical Abstracts and Beilstein – Subject Index, Substance Index, Author Index, Formula Index and other Indices with examples. Digital : Web resources – E-Journal – Journal access – TOC alerts – Hot articles – Citation index – Impact factor – H-Index – E-Consortium – UGC infonet – E-Books – Internet discussion groups and communities – Blogs – Preprint server – Search engines, Scirus, Google Scholar, ChemIndustry, Wiki – Databases, ChemSpider, ScienceDirect, SciFinder, Scopus.

### Unit 2 : Chemical Safety and Ethical Handling of Chemicals 14 hours

Safe working procedure and protective environment, protective apparel, emergency procedure and first aid, laboratory ventilation, Safe storage and use of hazardous chemicals, procedure for working with substances that pose hazards, flammable or explosive hazards, procedures for working with gases at above or below atmospheric pressures – safe storage and disposal of waste chemicals , recovery , recycling and reuse of laboratory chemicals, procedure for laboratory disposal of explosives , identification , verification and segregation of laboratory waste , disposal of chemicals in the sanitary sewage system , incineration and transportation of hazardous chemicals .

### Unit 3: Research Ethics and Intellectual Property Rights (IPR): (14 Hours)

Ethics – meaning and definition, Ethics Vs moral philosophy, nature of moral judgments and reactions. Rights and obligations of Research Participants. Scientific conduct – ethics with respect to science and research, intellectual honesty and research integrity. Scientific misconduct – falsification, fabrication and plagiarism. Publication ethics – meaning and importance, plagiarism and Self-plagiarism

IPR – Concept of IPR, nature and characteristics of IPR, origin and development of IPR, justification and rationale for protecting IPR, IPR and sustainable development, IPR and human rights,. Forms of IPR – copyrights, trademarks, patents, industrial designs, trade secrets, geographical indications

– meaning, features and application of different forms of IPRs. Filing and Registration process of IPRs.

## PS 547.1P : INORGANIC CHEMISTRY PRACTICALS – I

### Course Outcome:

Student will be able to:

- Estimate the quantity and quality of different compounds and metal ions using gravimetry, volumetry and complexometric techniques.

### Any 10 experiments are to be carried out

1. Analysis of Hematite-insoluble residue by gravimetry and Iron by volumetry using  $\text{Ce}^{4+}$ .
2. Analysis of Dolomite- insoluble residue by gravimetry and Ca, Mg by complexometry.
3. Pyrolusite- Insoluble residue by gravimetry and Manganese content by oxalate method.
4. Complexometric determination of Mn, Cu.
5. Complexometric determination of Ni and Fe-Cr mixture
6. Hardness of water
7. Analysis of Halide Mixture - Iodide by  $\text{KIO}_3$  and total halide by gravimetry.
8. Colorimetric Determination of Iron by thiocyanate and Cu by aqueous ammonia.
9. Gravimetric Determinations of Mn, Ni.
10. Analysis of solder - Pb and Sn by EDTA method.
11. Gravimetric Determinations of Mo, Pb/Cr, sulphide, thiocyanate.
12. Estimation of Cr(III) & Fe(III) in a mixture using EDTA.
13. Estimation of Ni(II) & Fe(III) in a mixture using EDTA.
14. Determination of free Chlorine in the given water sample
15. Any other experiment of interest

### REFERENCES :

1. Vogel's Text Book of Quantitative Chemical Analysis, G.H.Jeffrey, J.Bassette, J.Mendham and R.C.Denny, 6<sup>th</sup>Edn, Longman, 2009.

## PS 548.1P : ORGANIC CHEMISTRY PRACTICALS - I

### Course Outcome:

Student will be able to:

- Carry out multi-step organic synthesis
- Purify the synthesized organic compounds

### Any 10 experiments are to be carried out

1. Electrophilic substitution reactions–Preparations of p-bromoaniline, p-nitroaniline and picric acid
2. Alkylations–Preparations of nerolin and N-methyl anthranilic acid.
3. Acetylations–Preparations of  $\beta$ -D-glucose penta-acetate and 2-naphthyl acetate.
4. Reactions with ring formation–Preparations of 1,2,3,4–tetrahydrocarbazole and 7– hydroxy-4-methyl-coumarin.
5. Diazotisation reactions–Preparations of iodo, chloro and azo compounds.
6. Dehydration reactions–Preparations of cyclohexene and succinic anhydride
7. Condensation reactions–Condensations involving diethylmalonate and ethyl acetoacetate. Aldol condensation and Perkin reactions.
8. Oxidation reactions-Preparation of p-nitrobenzoic acid and adipic acid.
9. Halogenation reactions-Preparation of n-butylbromide &  $\alpha,\beta$ -dibromocinnamic acid.
10. Oxidation reactions–Preparation of adipic & p-nitrobenzoic acids and p- benzoquinone.
11. Reduction reactions–Reductions of nitro compounds and carbonyl compounds.
12. Preparation of Dibenzal Acetone.
13. Preparation of Cinnamic Acid from Benzaldehyde.
14. Preparation of Ethyl Aceto Acetate from Ethyl acetate.
15. Any other experiment of interest

### REFERENCES :

1. Laboratory Manual in Organic Chemistry, R. K. Bansal, 5<sup>th</sup>Edn, New Age, New Delhi, 2008.
2. Experimental Organic Chemistry–Vol. I & II, P. R. Singh et al, TMH New Delhi, 2013.

4. Practical Organic Chemistry, F G Mann, 4<sup>th</sup>Edn, Pearson Education, 2009.

## PS 549.1P : PHYSICAL CHEMISTRY PRACTICALS – I

### Course Outcome:

Student will be able to:

- Carry out experiments related to chemical kinetics, viscometry, Polarimetry, Refractometry, Conductometry and Potentiometry

### Any 10 experiments are to be carried out

1. Potentiometric titration of halides in mixtures ( $\text{Cl}^-$ ,  $\text{Br}^-$  and  $\text{I}^-$ ) with silver nitrate
2. Potentiometric determination of redox potentials.
3. Potentiometric determination of dissociation constants of weak acids
4. Potentiometric and conductometric acid–base titrations in partial & non-aqueous media.
5. Conductometric titrations of displacement and precipitation reactions
6. Determination of equivalent conductances and dissociation constants of weak acids.
7. Determination of solubility of lead iodide at different T & hence molar heat of solution
8. Determination of pH of buffer solutions with a pH meter & evaluation of pKa of acids
9. Analysis of a binary mixture and determination of molar refraction of a solid and the composition of chloroform and acetone in its azeotropic mixture by refractometry
10. Analysis of a binary mixture of two miscible liquids by viscometry and the relation between viscosity of a solution and the electrical conductivity
11. Study of variation of viscosity of a liquid with temperature
12. Determination of parachor value for  $\text{CH}_2$  group by S.T method, the composition of a solution by S.T measurement and the CMC of a soap solution by S.T measurement.
13. Potentiometric determination of solubility of insoluble silver halide and the standard electrode potential using quinhydrone electrode
14. Determination of degree of hydrolysis of  $\text{CH}_3\text{COONa}$  and  $\text{NH}_4\text{Cl}$ .
15. Determination of hydrolysis constant of aniline hydrochloride.
16. Verification of Nernst equation for  $\text{Ag}^+$ ,  $\text{Cu}^{2+}$  and  $\text{Zn}^{2+}$  species.
17. Determination of transport number of ions by emf method ( $\text{Ag}^+$ ,  $\text{Cd}^{2+}$ ,  $\text{NO}_3^-$ ,  $\text{SO}_4^{2-}$  etc.)
18. Any other experiment of interest

## SECOND SEMESTER

### PH 541.2: ADVANCED INORGANIC CHEMISTRY

#### Course Outcome:

Student will be able to:

- Understand the Chemistry of d block elements, Lanthanides and Actinides and explain their magnetic and electronic properties
- Describe the VB and MO theory of complexes and electronic and bonding reactivities of transition metals
- Explain the spectral and magnetic properties of metal complexes
- Describe the basic concepts of organometallic chemistry and their bonding patterns especially with unsaturated ligands

#### UNIT I:

14 Hours

*Definition of metallurgy - roasting and calcination, reduction of mineral to metal (electrolytic reduction, chemical reduction and auto reduction), General characteristics of d and f block elements, lanthanide and actinide contraction.*

**Reduction of Ores:** Methods of reduction of oxide ores Ellingham diagram, chemical and electrolytic reductions, reduction potentials, Latimer and Frost diagrams, Pourbaix diagram, effect of complexation on potential.

**d block elements:** Comparison of 3d, 4d and 5d series by taking Titanium subgroup as example.

**Lanthanides and actinides:** extraction and separation of lanthanides, spectral and magnetic properties of lanthanide and actinide complexes, lanthanide and actinide contraction Comparison of spectral and magnetic properties of lanthanides and actinides with d-block ions.

#### UNIT II:

14 Hours

*Review of basic concepts of co-ordination chemistry, Valence bond and Crystal field theories, Concept of hybridization coordination number and geometry in coordination compounds. Stepwise and overall formation constants, factors affecting stability of metal complexes.*

**Complexes with Coordination numbers** 2-10 and their geometry, crystal field theory of coordination compounds, d-orbital splittings in octahedral, square planar and tetrahedral fields, spectrochemical series, Jahn-Teller effect.

**Evidences for ligand field splitting:** hydration, ligation and lattice energies, site preference energies. Metal – ligand orbital overlap from ESR, NMR, electronic spectra and antiferromagnetic coupling, nephelauxetic effect and nephelauxetic series, MO theory of coordination compounds-MO energy level diagrams for octahedral, tetrahedral and square planar complexes.

Determination of composition and stability constants of complexes by spectrophotometry (Job's method) and potentiometry, stepwise stability constants by Bjerrum's pH-titration method, Rossotti and Rossotti method, Bjerrum's spectrophotometric method and ion exchange method

**UNIT III:****14 Hours**

*Concept of pi acceptor ligands, back bonding, bonding in metal carbonyls, 18 electron rule*

**Metal Pi-acceptor complexes:** Metal carbonyls – preparative methods, structure and bonding, vibrational spectra of metal carbonyls for bonding and structural elucidation, magnetic and X-ray evidences of structures. Reactions of metal carbonyls. Metal carbonylates and carbonyl halides – preparation and important reactions with Applications. Chemistry of metal nitrosyls – preparation, structure and bonding; dinitrogen and tertiary phosphine complexes, ligand cone angle in phosphine complexes, complexes containing SO<sub>2</sub> and CO<sub>2</sub>

**Metal complexes as liquid crystals:** Stereochemical non-rigidity, Stereoisomerism – chirality, optical activity, CD, ORD, Cotton effect

**Metal-metal bonding in carbonyls and halides:** Evidences for M-M bonding, factors favouring M-M bond formation.

**UNIT IV:****14 Hours**

*Quantum numbers and their significance. Brief review of different types of magnetic behaviour*

**Electronic spectra of transition metal complexes:** Spectroscopic term symbols for d<sup>n</sup> ions, ground states, microstates, microstate table for p<sup>2</sup> and d<sup>2</sup> system. selection rules, Racah parameters, Orgel, Tanabe-Sugano diagrams, spectra of 3d metal aqua complexes of trivalent, V, Cr, divalent Mn, Co and Ni, [CoCl<sub>4</sub>]<sup>2-</sup>, calculation of Dq, B and β parameters, charge transfer spectra.

**Magnetic properties of metal complexes:** Origin and types of magnetic behaviour- diamagnetism, paramagnetism, ferro and antiferromagnetism, magnetic susceptibility and its measurement by the Guoy method, temperature dependence of magnetism – Curie and Curie-Weiss laws, Curie Temperature and Neil temperature, types of paramagnetic behaviour, spin only behaviour, spin orbit coupling, quenching of orbital contribution and spin only behaviour (explanation based on A, E and T terms), application of magnetic data.

8. Inorganic Chemistry, Meissler and Tarr, 5<sup>th</sup>Edn, Pearson Prentice Hall, 2013.

## PH 542.2: ADVANCED ORGANIC CHEMISTRY

### Course Outcome:

Student will be able to:

- Describe the mechanisms of different types organic reactions.
- Understand the chemistry of radical reactions and its applications.
- Understand the mechanism of additions to various Carbon-based multiple bonds
- Achieve skills in constructing homo/heterocyclic rings of significant molecules

### UNIT I

14 hours

*Generation of Nucleophiles and electrophiles, electrophilic and Nucleophilic substitution reactions.*

**Aliphatic Nucleophilic Substitution Reactions:** Mechanism and scope of aliphatic nucleophilic substitution reactions -  $S_N1$ ,  $S_N2$  and  $S_Ni$ . Stereochemistry of nucleophilic substitution reactions, allylic, vinylic and benzylic nucleophilic substitution reactions, neighbouring group participation and anchimeric assistance. Factors influencing the rates of nucleophilic substitution reactions.

**Aliphatic Electrophilic Substitution Reactions:** Bimolecular mechanisms- $S_E1$ ,  $S_E2$  and  $S_{Ei}$  mechanism. Electrophilic substitution reactions accompanied by double bond shifts.

**Aromatic Electrophilic and Nucleophilic Substitution Reactions:** Mechanism of aromatic electrophilic substitution reaction pathway, Arenium ion mechanism, orientation and reactivity, energy profile diagram. The ortho/para ratio, ipso attack, orientation in other ring systems. Mechanism of Mannich Reaction.

**Mechanisms of aromatic nucleophilic substitution reactions:**  $S_NAr$ ,  $S_N1$  and aryne mechanism. Von-Richter rearrangement, Sommelet-Houser rearrangement, Smiles rearrangement.

### UNIT II

14 hours

*Elimination reactions, dehydration, dehydrohalogenation and dehalogenation*

**Free Radical Reactions:** Types of radical reactions, mechanisms of free radical substitution reactions and neighbouring group assistance. Reactivity for the aliphatic and aromatic substances at a bridgehead. Reactivity of the attacking radical. The effect of solvent on reactivity. Auto-oxidation, coupling of alkynes. Arylation of aromatic compounds by diazonium salts. Sandmeyer, Ullmann and Hunsdiecker reaction

**Elimination Reactions:** Discussions of  $E1$ ,  $E2$ ,  $E1cB$  and  $E2cB$  mechanisms. Orientation during elimination reactions. Saytzeff and Hofmann rules. Reactivity-effects of substrate structures, attacking base, leaving group and solvent medium.

**Pyrolytic Eliminations:** Mechanisms of pyrolysis of esters of carboxylic acids, (acetate pyrolysis), Chugaev reaction, Hofmann degradation and Cope elimination

**UNIT III****14 hours**

*Addition and condensation reactions, aldol condensation and Perkin reaction*

**Formation and Hydrolysis of Esters:** Plurality of mechanism. Mechanism of esterification reactions. Ester hydrolysis- $A_{AC}2$ ,  $B_{AC}2$ ,  $A_{AC}1$  &  $A_{AL}1$  mechanism. Transesterification – acetyl and benzoyl migrations.

**Addition to Carbon-Carbon Multiple Bonds:** Addition reactions involving electrophiles, nucleophiles and free radicals. Cyclic mechanisms. Orientation and stereochemistry. Addition of halogens, hydrogen halides, carboxylic acids and amines. Addition to cyclopropanes, hydroboration, Michael addition. Addition of oxygen across double bonds.

**Addition to Carbon-Hetero Multiple Bonds:** Electrophilic, nucleophilic and free radical additions to C=O and C=N systems. Addition of Grignard reagents. Reformatsky reaction, Knoevenagel condensation and Wittig reactions.

**UNIT IV****14 hours**

*Introduction and classification of heterocycles*

**Chemistry of Heterocyclic Compounds:** Nomenclature of 3,4, 5, 6 membered heterocyclic and fused heterocycles, synthesis and reactions of oxiranes, thiranes, aziridines, azirenes. Structure, synthesis and reactions of pyrrole, thiophene, furan. Synthesis and reactions of pyridine, quinoline, isoquinoline, indole. Synthesis and reactivity of heterocycles containing two hetero atoms (pyrazole, imidazole, thiazole).

15. Heterocyclic Chemistry, J A Joule & K Mills, 5<sup>th</sup>Edn, Wiley-Blackwell, 2010.

## PH 543.2: ADVANCED PHYSICAL CHEMISTRY

### Course Outcome:

Student will be able to:

- Gather knowledge of Quantum Chemistry and its application
- Explain the approximation methods in quantum mechanics
- Explain the relationship between microscopic properties of molecules with macroscopic thermodynamic observables
- Describe the quantum mechanical explanation of chemical bonding

### UNIT - I :

**14 hours**

Bohr's theory of hydrogen atom. Comparison of classical and quantum mechanical particles. Cartesian, Polar and spherical polar coordinates and their interrelations. Operators, matrix representation and commutation relationships, Angular momenta (commutations, relations, operators). Schrödinger equation, significance and characteristics of wave function, eigen functions and eigen values. Probabilities, normalisation and orthogonality. Postulates of quantum mechanics  $\phi, \theta$  Solution of Schrödinger wave equation for exactly solvable problems such as particle in a box (1D and 3D), particle in a ring, harmonic oscillator, rigid rotor and hydrogen atom (separation of  $r, \phi, \theta$  equations and their solutions).

### UNIT-II:

**14 hours**

*Pauli exclusion principle, Term symbols, Russell-Saunders terms and coupling schemes*

**Approximate methods in quantum chemistry:** Approximate methods of solving Schroedinger equation for problems of chemical interest - variation and perturbation methods. Application of variation method to H & He atoms, the structure of many electron systems/atoms (secular equations & determinants). Spin-orbit interaction, antisymmetry, Slater orbitals and SCF method for many electron systems.

**Molecular wave functions:** Born-Oppenheimer approximations. Covalent bond –valence bond and molecular orbital approaches with comparisons. Hydrogen molecule – Heitler-London (VB) treatment. Energy level diagram. MO theory applied to homonuclear and heteronuclear diatomics by LCAO methods, correlation diagrams, non-crossing rule.

### UNIT -III :

**14 hours**

*Hybridization and Valence Bond Theory (VBT), Molecular Orbital Theory(MOT).*

**Theory of directed valence** - Geometry of molecules in terms of molecular orbitals (bond angle, dihedral angle), localised and delocalised molecular orbitals.

**Conjugated and aromatic molecules:** Huckel molecular orbital (HMO) theory of linear conjugated systems (ethene, allyl & butadiene systems) and aromatic molecules (benzene as an example). Calculation of delocalization energies, bond order & charge density. An introduction to Extended Huckel Theory.

#### UNIT - IV :

14 hours

*Concept of molecular energy levels. Maxwell's distribution of molecular velocities*

**Statistical Thermodynamics :** Micro and macrostates, phase space and ensembles. Concept of distribution - thermodynamic probability and most probable distribution - Maxwell-Boltzmann distribution law. Maxwell-Boltzmann statistics and applications, Bose-Einstein and Fermi-Dirac statistics. Partition functions - definitions and separations, evaluation of translational, rotational, vibrational and electronic partition functions for monoatomic, diatomic and polyatomic gaseous molecules. Calculations of thermodynamic functions and equilibrium constant in terms of partition functions, entropy of monoatomic gas - Sackur-Tetrode equation, comparison of 3rd law and statistical entropies. Heat capacity behaviour of solids – Einstein and Debye theories. Introduction to Irreversible Thermodynamics

7. Principles of Physical Chemistry, Puri, Sharma and Pathania, 1<sup>st</sup>Edn, 2008.
8. Elementary Quantum Chemistry, F. L. Pilar, McGraw Hill, 2<sup>ne</sup> Edn., 1990.
9. Molecular Quantum Mechanics, P. W. Atkins & R. S. Friedman, Oxford University Press, 5<sup>th</sup> Edn., 2012.

## PS 544.2: MOLECULAR SYMMETRY AND MOLECULAR SPECTROSCOPY

### Course Outcome:

Student will be able to:

- Apply the principles of group theory in chemical bonding.
- Define aspects of specific spectroscopic techniques, applications of molecular symmetry in Microwave and Vibrational spectroscopy
- Define aspects of specific spectroscopic techniques, applications of molecular symmetry in Rotational and Raman spectroscopy

### UNIT – I :

14 hours

*Elements of Symmetry, Definitions of groups and sub groups, symmetry operations*

**Symmetry and Group Theory :** Relation between orders of a finite group and its subgroup and group multiplication tables, Conjugate relationships and classes, Schoenflies symbols, Matrix representations of symmetry operations, products of symmetry operations, some properties of matrices and vectors, classification of molecules into point groups. Reducible and irreducible representations. Mulliken's symbols for IR's The Great Orthogonality theorem (without proof), character tables for  $C_{2v}$ ,  $C_{3v}$ , and  $C_2$  point groups, the direct product. Transformation properties of atomic orbitals. Applications of group theory to molecular vibrations and chemical bonding (IR & Raman).

### UNIT – II :

14 hours

*Rigid rotator definition & derive  $I = \mu r^2$ . Electromagnetic radiation, dual nature, regions of the spectrum.*

**Unifying Principles:** Interaction of electromagnetic radiation with matter - absorption, emission, transmission, reflection, refraction, dispersion, polarization and scattering. Natural line width and broadening, intensity of spectral lines

**Microwave Spectroscopy:** The rotation and classification of molecules, selection rules, rotation spectra of diatomic and polyatomic molecules. Rigid and non-rigid rotator models. Determination of bond lengths, isotope effect on rotation spectra. Stark effect, nuclear and electron spin interaction. Microwave Spectrometer.

**Vibrational Spectroscopy:** Vibration spectra of diatomic molecules - linear harmonic oscillator, vibrational energies, zero point energy, force constants and bond strengths, anharmonicity of molecular vibrations - Morse potential energy diagram, selection rules, fundamental, overtones and hot bands. Vibrations of polyatomic molecules - normal modes of vibrations and nature of molecular vibrations (Ex -  $CO_2$  and  $H_2O$ ).

### UNIT –III :

14 hours

*Introduction to Raman Spectroscopy, Stokes and Anti Stokes lines.*

**Vibration-rotation spectra** of diatomic and polyatomic molecules, selection rules, PQR branches. IR Spectrophotometer-Instrumentation, sample handling techniques, FTIR Spectroscopy - Instrumentation

**Raman Spectroscopy:** Classical and quantum theories of Raman effect, concept of polarizability and polarizability ellipsoid. Rotational and vibrational Raman spectra, selection rules, Raman activity of vibrations, mutual exclusion principle, polarization of Raman lines. An introduction to Laser Raman Spectroscopy. Raman Spectrometer – instrumentation. Applications of IR and Raman spectroscopy in elucidation of molecular structure (Ex - H<sub>2</sub>O, N<sub>2</sub>O & CO<sub>2</sub> molecules). An introduction to Resonance Raman Spectroscopy. Advantages of Raman spectroscopy over IR spectroscopy.

8. Symmetry and Spectroscopy of molecules, K Veera Reddy, 2<sup>nd</sup>Edn, 2010.

## PS 545.2 : CHEMISTRY OF BIOMOLECULES

### Course Outcome:

Student will be able to:

- Explain the structure and role of biomolecules like peptide, proteins and lipids
- Understand the chemical principles of living cells, their biomolecules and biocatalytic reactions.
- Detail the synthesis and stereochemistry of carbohydrates

### UNIT I :

14 Hours

*Cell Structure and Functions: Structure of prokaryotic and eukaryotic cells, intra cellular organelles and anabolism, comparison of animal and plant cells*

**Overview of metabolic processes-** catabolism and anabolism. ATP- the biological energy currency. Origin of life - unique properties of carbon, chemical evolution and rise of living systems.

**Lipids:** Fatty acids, essential fatty acids, structure and function of triglycerides, glycerophospholipids, sphingolipids, cholesterol, bile acids, prostaglandins.

**Lipoproteins:** Composition and function, role in atherosclerosis, properties of lipid aggregates, micelles, bilayers, liposomes and their biological functions. Biological membranes-Fluid mosaic model of membrane structure. Lipid metabolism (oxidation of fatty acids).

### UNIT II :

14 Hours

*General structure, classification, D and L Notation.*

**Amino Acids :** Specific rotation, distribution in proteins, location in proteins, physical properties, non-standard protein aminoacids and non-protein aminoacids. General methods of synthesis of synthesis of aminoacids with specific examples.

**Steroids and Hormones:** Classification of steriods, Biological importance, Cholesterol, Occurance, properties, test and physiological activities of cholesterol. Sex hormones, thyroid gland hormones and adrenal gland hormones.

**Enzymes:** Enzymes in organic synthesis,  $\alpha$ -carboxy peptidase-A and Ribonuclease. Enzymatic synthesis of  $\alpha$ -amino acids and peptides. Transformations of lipases and esterases. Kinetic resolutions of carboxylic acids, esters and alcohols-Trans esterification. Enzymatic synthesis of  $\alpha$ -amino acids and peptides.

### UNIT III :

14 Hours

*Introduction, Definition, classification, reducing and non reducing sugars.*

**Carbohydrates :** Configuration and conformation of monosaccharides, Chemistry of important derivatives of monosaccharides - ethers, esters, acetals, ketals, deoxysugars, aminosugars, structure of disaccharides - maltose, cellobiose and sucrose. Structure of tri and tetra saccharides.

General methods of structural degradation of polysaccharides-methylation, partial hydrolysis, per iodate oxidation, Smith degradation and alkaline degradation techniques. Structures of cellulose,

chitin, starch(Amylose and amylopectin), glycogen, heparin and chondroitin. Hemicelluloses, regenerated cellulose and cellulose derivatives.

## PS 546.2P : INORGANIC CHEMISTRY PRACTICALS – II

### Course Outcome:

Student will be able to:

- Estimate binary mixtures of metallic ions in solution
- Analyse the presence of inorganic salts qualitatively

Qualitative Analysis of mixtures of Inorganic Salts containing 3 metal ions and 2 anions (1 less common metal ions like Tl, W, Mo, V, Zr, Th, U, Ce, Ti and Li to be included among anions organic acid radicals, phosphate, borate and fluoride separation included).

### REFERENCES

2. Vogel's Qualitative Inorganic Analysis, G.Svehla, 7<sup>th</sup>Edn, Longman, 2006.

## PS 547.2P : ORGANIC CHEMISTRY PRACTICALS – II

### Course Outcome:

Student will be able to:

- Separate and analyse the binary mixture of Organic Compounds

Separation and Systematic Qualitative Analysis of Binary Mixtures of Organic Compounds

### REFERENCES :

1. Practical Organic Chemistry, F .G. Mann and B. C. Saunders, 4<sup>th</sup>Edn, ELBS, England, 2009.

6. Vogel’s Text Book of Practical Organic Chemistry, Furniss, 5<sup>th</sup>Edn, Pearson India, 2005.

## PS 548.2P : PHYSICAL CHEMISTRY PRACTICALS – II

### Course Outcome:

Student will be able to:

- Determine cryoscopic constants, dissociation constants and various other physical properties of compounds

### At least 10 experiments are to be carried out

1. Determination of cryoscopic constants of solvents and molecular weight of non volatile substances using water and benzene as solvents.
2. Determination of degree of dissociation & Vant Hoff factor of an electrolyte by cryoscopic method.
3. Heat of solution of substances by solubility method.
4. Phase diagram of two component systems by thermal analysis.
5. Kinetics of acid catalysed hydrolysis of methyl acetate and determination of (a) order and rate constant, (b) Relative strength of two acids and (c) Energy of activation.
6. First and second order kinetics of reaction between potassium persulphate and KI.
7. Kinetics of (a) inversion of cane sugar, (b) sodium formate–iodine reaction .
8. Determination of heat of neutralisation, integral and differential heat of solution calorimetrically. Thermometric titration of an acid with a base.
9. Determination of association constants carboxylic acids in organic solvents by distribution method.
10. Preparation of colloidal solutions.
11. Verification of F & L adsorption isotherms for acetic acid on activated charcoal.
12. To study the adsorption of iodine on charcoal from alcoholic solution.
13. To study the effects of gelatin solution on the precipitation values.
14. To compare the cleaning powers of two samples of detergents.
15. Any other relevant experiments of interest.

### REFERENCES:

## PO 549.2- ANALYTICAL TECHNIQUES

### Course Outcome:

Student will be able to:

- Gain a domain knowledge about biomolecules and the chemistry related to it
- Understand different electro-analytical techniques

Understand the chemistry of Polymers

### UNIT I: Biomolecules and Analysis

14 Hours

*Dairy products- composition of milk and milk products; Carbohydrates- sources and classification; Vitamins: Classification and Nomenclature*

**Carbohydrates** : Structure of monosaccharides - Glucose and Fructose, Disaccharides – Sucrose and Maltose. Polysaccharides – Starch and Cellulose

**Vitamins**:. Source and deficiency diseases, biological functions of Vitamins- Vitamin A<sub>2</sub>, Vitamin B, Vitamin C & Vitamin K.

**Food Analysis**:. Analysis of fat content, minerals in milk and butter, Estimation of added water in milk. Analysis of caffeine in coffee and tea, detection of chicory in coffee, chloral hydrate in toddy, estimation of methyl alcohol in alcoholic beverages.

**Food additives**: Food preservatives like benzoates, propionates, sorbates, bisulphites. Artificial sweeteners like saccharin, dulcin and sodium cyclamate. Some examples of adulterants and contaminants

**Flavours** - Vanillin, esters (fruit flavours) and monosodium glutamate. Artificial food colourants - coal tar dyes and non-permitted colours and metallic salts.

### UNIT II: ELECTROANALYTICAL TECHNIQUES

14 Hours

*Electrochemical cells- types, Electrode Potential, Cell Potential, salt bridge Representation of cell, Electrolytes and types of electrolytes.*

**Introduction to electrochemistry**: Indicator Electrodes, Reference electrodes.

**Potentiometry**: Principle, Potentiometric titrations, Applications.

**Conductometry**: Definitions, conductance measurement, Conductometric titrations and applications

**Voltammetric Techniques**: Polarization, overvoltage, mechanism of mass transport. Theory of classical polarography, polarographic measurements, polarographic currents, cyclic voltammetry.

### UNIT III- ANALYTICAL CHEMISTRY OF POLYMERS

14 Hours

*Monomers, general structure and naming of polymers*

**Basic concepts**: Classification of Polymers.

**Determination of molecular weights** - Number average molecular weight and weight average molecular weight concept; Viscosity, light scattering, osmometry and sedimentation method, GPC techniques.

**Thermal Characterization**: Glass transition temperature and melting point correlation with structure - Factors affecting T<sub>g</sub> and T<sub>m</sub>. Characterization of polymers using DSC, DTA, DTG and TGA techniques.

## THIRD SEMESTER

### PH 541.3 ORGANOMETALLIC, BIOINORGANIC AND COORDINATION CHEMISTRY

#### Course outcomes:

Student will be able to:

- Describe the basic concepts, synthesis, reaction chemistry of organometallic compounds and the structure and bonding patterns.
- Detail the mechanism of different organometallic reactions and catalysis and their application as industrial catalysts.
- Understand the nomenclature, metal-ligand reactions and their mechanism and identify the bonding, structure, and reactivity of selected coordination complexes.
- Understand the role and interaction of Metal ions in biological systems.

#### UNIT I

14 hours

*Introduction to Organometallic compounds and classification*

Classification based on ligands in organometallic compounds, nomenclature, 18-electron rule, counting of electrons in complexes, exception for 18 electron rule. Synthesis, structure and bonding in Li, Be, Mg and Al alkyls. Transition metal complexes with carbenes and carbynes. Synthesis, structure and bonding of transition metal complexes with  $\pi$ -ligands (alkenes, alkynes, dienes, cyclopentadienes, arenes, cycloheptatrienes, COD, COT). Grubb's and Tebbe's Reagents.

#### UNIT II

14 hours

*Characteristics of a catalyst, types of catalysis.*

Catalysis by organometallic compounds, conditions to be a catalyst, Wilkinson's catalyst, preparation, mechanism of hydrogenation of olefins, Hydroformylation of olefins (oxo process-Cobalt and Rhodium catalysts), mechanism. Isomerization of olefins-mechanism. Oxidation of olefins- Wackers process, steps involved in Wacker's process. Monsanto acetic acid process, Ziegler Natta catalysis-Mechanism. Fisher -Tropsch reaction, Water gas Shift reactions-Mechanism.

#### UNIT III

14 hours

*Role of metal ions in biological systems, classification of metal ions and applications of metal ions.*

Ion transport across membrane, ionophores,  $\text{Na}^+/\text{K}^+$  pump,  $\text{Ca}^{++}$  pump. Transport and storage of dioxygen-Haemoglobin, oxygen uptake, functions of haemoglobin, myoglobin, Physiology of myoglobin and haemoglobin, haemocyanin & hemerythrin.

Metal storage and transport-ferritin, transferrin and ceruloplasmin.

Electron transfer proteins-cytochromes- cytochrome c, iron sulphur proteins

Nitrogen fixation, bacterial nitrogenase enzyme.

## Unit IV

14 hours

*Types of substitution reactions,  $S_N1$  and  $S_N2$  reactions and their mechanisms.*

**Reaction mechanisms in transition metal complexes:** Energy profile of a reaction, inert and labile complexes, kinetics of octahedral substitution and mechanistic aspects. Acid hydrolysis, Factors affecting acid hydrolysis, mechanism of acid hydrolysis, base hydrolysis, conjugate base mechanism. Substitution reactions in square planar complexes, trans effect, theories of trans effect, mechanism of substitution. Electron transfer reactions- inner sphere and outer sphere reactions, complimentary and non complimentary reactions.

## PH 542.3: ELECTROANALYTICAL RADIOCHEMICAL AND THERMOANALYTICAL TECHNIQUES

### Course outcomes:

Student will be able to:

- Describe the principles of electrochemistry and applications of electromotive force.
- Explain the principles of irreversible thermodynamics and bioenergetics
- Demonstrate a systematic understanding of the key aspects of nuclear chemistry and their analytical applications.
- Understand and apply various electro-analytical techniques in qualitative and quantitative analysis.

### UNIT I:

14 Hours

*Concepts of electrochemical cells and types. Electrolytes and types of electrolytes.*

**Review of Basic concepts in electrochemistry:** Electrochemical Cells: Components, conduction, reactions, liquid junctions, salt bridge Faradaic and non-Faradaic currents. Reversible and irreversible cells. Polarization, overpotential and hydrogen overvoltage.

**Electrode Potential:** Nature, measurement, sign convention, electrochemical series and its significance. Effect of concentration. Standard electrode potential, calculation limitations.

**Cell Potential:** liquid junction potential, effect of current, Ohmic potential. Calculation of thermodynamic quantities of cell reactions ( $dG$ ,  $dH$  and  $K$ )

**Indicator Electrodes:** Metallic Electrodes: Electrodes of first, second third kind and redox type.

**Membrane Electrodes:** Classifications and properties, principle, design, theory of ion selective electrodes, membrane potential, selectivity, crystalline liquid membrane and enzyme electrodes, Gas sensing probes. Semiconductor electrode.

Glass Electrode: Composition, hygroscopicity, asymmetry potential, acid and alkali errors.

**Reference electrodes-** calomel, silver/silver chloride and hydrogen electrodes.

Direct potentiometry and Potentiometric titrations - applications.

Conductometric methods: Definitions, conductance measurement, Conductometric titrations and applications

### UNIT II: Voltammetric Techniques

14 Hours

*Polarization, Sources, overvoltage and factors affecting overvoltage, concentration polarization, mechanism of mass transport*

Theory of classical polarography, polarographic measurements, polarograms, polarographic currents. Current and concentration relationship. Factors influencing diffusion currents, oxygen interference, advantages and limitations,

DC polarography-Ilkovic equation, half wave potential, Modified voltammetric methods, pulse polarography, fast, linear -sweep polarography, first and second order polarographic techniques. Organic polarography, applications, cyclic voltammetry: Principle and applications.

**Stripping Analysis:** Principle and Applications.

**Amperometry:** Principle, titrations, advantages and limitations. Biamperometric titrations

### **UNIT III**

**14 Hours**

*Faraday's Laws of electrolysis. Definition of natural and artificial radioactivity, characteristics of  $\alpha$ ,  $\beta$  and  $\gamma$  rays*

**Coulometry:** Principle, constant current and controlled potential coulometry. Applications of coulometric titrations

**Electrogravimetry:** Decomposition potential and its significance. Effect of experimental variables-physical and chemical. Electrolysis at constant current and at controlled potentials, applications,

**Chrono Methods:** Basic concepts, methodology and application of chronopotentiometry, chronoamperometry and chronocoulometry

#### **Radiochemical Methods of Analysis (Radioanalytical Techniques)**

Introduction, the nature of radioactivity, radiometric units, detection and measurements of radioactivity. Radioactive tracers, tracer techniques. Application in analytical chemistry, isotopic dilution analysis, radio immuno assay, activation analysis and prompt gamma neutron activation analysis (PGNAA). Radiometric analysis, radiometric titrations and applications

### **UNIT IV: Thermoanalytical Techniques**

**14 Hours**

*Effect of temperature on solids, liquids, gases, and on hydrated organic and inorganic compounds.*

Introduction, thermogravimetric analysis(TGA), types of thermogravimetric analysis, principle and methods. Automatic thermogravimetric analysis, instrumentation, types of recording thermobalances, sample holders, factors affecting results and applications. Differential thermal analysis (DTA), principle of working, theory and instrumentation. Simultaneous DTA-TGA curves, factors affecting results and applications. Differential scanning calorimetry (DSC), principles, instrumentation and applications. Dilatometry. Thermometric titration: introduction, apparatus and applications (Acid-base, precipitation, complexation, redox and non-aqueous titrations).

9. Nuclear and Radiochemistry, Friedlander, Kennedy and Miller, 3<sup>rd</sup>Edn, 1981.
10. Instrumental methods of Analysis, Willard, Merritt, Dean, Settle, 7<sup>th</sup>Edn, CBS Pubs, 2007.
11. Instrumental methods of Chemical Analysis-Gurdeep R Chatwal, 5<sup>th</sup>Edn, Himalaya Publishing House, 2007

### Course outcomes:

Student will be able to:

- Gather knowledge about various spectroscopic techniques such as IR, NMR UV and Mass spectroscopy analysis.
- Understand theory and application to mass spectrometry, ultraviolet and visible spectroscopy, infrared spectroscopy, nuclear magnetic resonance spectroscopy.
- Apply NMR, IR, MS, UV-Vis spectroscopic techniques in solving structure of organic molecules.

### UNIT - I

14 hours

*Theory of NMR, nuclear spin and magnetic spin chemical shift and its measurements*

**Nuclear Magnetic Resonance Spectroscopy:** Magnetic properties of nuclei, NMR spectrometer, FT-NMR and its advantages. Solvents used, factors affecting chemical shift. Integration of NMR signals, spin-spin coupling, coupling constant. Shielding and deshielding. Chemical shift assignment of major functional groups, Classification (ABX, AMX, ABC, A<sub>2</sub>B<sub>2</sub> etc.), spin decoupling; effects of chemical exchange, fluxional molecules, Hindered rotation through NMR spectrum, Karplus relationships (Karplus curve—variation of coupling constant with dihedral angle), double resonance techniques, NMR shift reagents, solvent effects and Nuclear Overhauser Effect (NOE). High resolution <sup>1</sup>H NMR spectroscopy. Applications of NMR spectroscopy in structure elucidation of simple organic and inorganic molecules. <sup>1</sup>H NMR in the structural study of complex organic compounds. Use of NMR in Medical diagnostics. Introduction to 2 D techniques: COSY

**NMR studies of nuclei other than proton:** <sup>13</sup>C chemical shift and factors affecting the chemical shift, Coupling constants. Decoupling—Noise decoupling and broad band decoupling. Off-resonance proton decoupling—some representative examples.

### UNIT - II:

14 hours

**UV/Electronic Spectroscopy:** *Beer-Lambert's law, Auxochromes and Chromophores.* Woodward, Woodward–Fieser rules. UV absorption of aromatic compounds - effect of substituents and solvent effects. Empirical rules to calculate λ<sub>max</sub>. Application of UV spectroscopy in the structural study of organic molecules and quantitative applications. Spectrophotometric titrations and simultaneous determinations.

**Mass Spectrometry:** Basic principles, Instrumentation - Mass spectrometer, interpretation of mass spectra, resolution, molecular ions, meta-stable ions and isotope ions. Fragmentation processes—representation of fragmentation. Factors influencing fragmentations and reaction pathways. McLafferty rearrangement. Fragmentations (fragmentation of organic compounds with respect to their structure determination) associated with functional groups— alkanes, alkenes, cycloalkanes, aromatic hydrocarbons, halides, alcohols, phenols, ethers, aldehydes, ketones, carboxylic acids, esters, amides, amines and nitrogen heterocycles. Ion analysis, ion abundance, retro Diels-Alder fragmentation. Nitrogen rule. Combined spectroscopic problems.

### UNIT –III

14 hours

*Types of molecules showing vibrational spectra, types of molecular vibrations (i.e., IR active & IR inactive)*

**Application of infrared spectroscopy** in the structural study-identity by fingerprinting and identification of functional groups. Characteristic vibrational frequencies of common functional groups (alkanes, alkenes, alkynes, aromatic compounds, alcohols, ethers, phenols and amines).study of vibrational frequencies of carbonyl compounds (ketones, aldehydes, esters, amides, acids, etc.). Factors affecting band positions and intensities such as effect of hydrogen bonding, phase and solvent on vibrational frequencies, overtones, combination bands and Fermi resonance. NIR and FIR spectroscopy.

**Structural Elucidation** :Determining the structure of organic compounds from the combination of spectra. Presence of fragments from the mass spectrum, relative number of protons in different environments from the  $^1\text{H}$  NMR spectrum, number of carbons in different environments from  $^{13}\text{C}$  spectrum, the presence or absence of functional groups from IR spectrum and examining the UV spectrum for evidence of conjugation, aromatic rings etc.

11. Organic Structures from Spectra, L D field, 5<sup>th</sup>Edn, 2013

#### **PS 544.3 : MEDICINAL CHEMISTRY**

#### **Course outcomes:**

Student will be able to:

- Explain the mechanism of drug action and drug designing.
- Understand the classification, structure and mechanism of drugs action.
- Develop an understanding on various CNS depressants

#### UNIT I :

14 Hours

*Introduction to drugs, classification and nomenclature of drugs*

**Drugs :** Theories of drug action. Drug design, analogues and pro drugs. Factors governing drug design, rational approach to drug design, tailoring of drugs, Physico-Chemical factors and Biological activities. Factors governing ability of drugs.

**General Anaesthetics:** Introduction and classification. Synthesis of Halothane, Methoxyfluorane and Methohexital sodium. Thiopental sodium, mode of action.

**Local Anaesthetics:** Introduction and classification. Synthesis of benzocaine, butamben, Procaine hydrochloride, tetracaine hydrochloride, butacaine sulphate,  $\alpha$ -eucaine, Benamine hydrochloride, Lignocaine, Prilocaine and Mepivacaine. Mode of action of benzocaine, butacaine sulphate, Mepivacaine, Procaine hydrochloride and Prilocaine

#### UNIT II :

14 Hours

*Analgesics, Narcotics and non-narcotics*

**Antibiotics:** Mechanism of action of following antibiotics, Penicillin-Stereochemistry, Synthesis of Penicillin-G, Chemical degradation and bacterial resistance.

**Cephalosporins**-Nomenclature, degradation and  $\beta$ -Lactamase resistance. Tetracyclines, Streptomycin and Chloramphenicol-SAR studies.

**Analgesics and anti inflammatory agents:** Narcotic and non-narcotic agents- Introduction and mechanism of action. Synthesis of Ibuprofen, Acetaminophen and Phenyl butazone.

**Antiarrhythmic agents:** Introduction, mechanism of action and synthesis of verapamil.

**Antihypertensive agents:** Introduction, Mechanism of action, Synthesis of Clonidine and Hydralazine derivatives.

**Hypoglycemic Agents :** Introduction, Mechanism of action, synthesis of Tolbutamide and Tolazamide.

**Anti-amoebic agents:** Introduction, Classification, Mechanism of action, synthesis of metronidazole, Iodoquinol and dimercaprol.

#### UNIT III:

14 Hours

*Introduction and classification of CNS depressants*

**CNS depressants:** Sedative and hypnotic agents: Synthesis of Barbitone, Methylphenobarbital, Butobarbital, Chloralhydrate, Diazepam, Phenobarbital.

**AntiConvulsants** : Synthesis of Phenytoin sodium, Trimethadion, Carbamazepine.

**CNS Stimulants** : Introduction and classification. Synthesis and mechanism of action of caffeine, Nikethamide, Phetermine, Methylphenidate.

**Anti Histaminic Agents**: Mechanism of action, synthesis of Diphenhydramine hydrochloride, Pyrilamine, Pheniramine.

**Anti Malarials** : Etiology of Malaria, mechanism of action and SAR studies of Quinolines antimalarials. Synthesis of Chloroquin, Primaquin and Quinacrine.

## PS 545.3P: COMPUTERS FOR CHEMISTS – PRACTICALS

### Course Outcome:

Student will be able to:

- Understand about the different operating systems and software's
- Get a training on using subject specific software's.
- Get hands-on experience to use the relevant software's

### UNIT I

14 Hours

*Overview of the computer system, parts of the computer system, physical components. How to operate a PC, MS-Word and MS-Power Point basics.*

**Introduction to computers and computing:** Basic structure and functioning of computers with a PC as an illustrative example. Memory, I/O devices. Secondary storage. Computer languages. Data processing, principles of programming. Algorithms and flow charts

#### **Operating Systems & Word Processing:**

Basic Idea of DOS, WINDOWS, UNIX & Android;

Working with MS-Word: Formatting text & documents, sorting & tables, Introduction to mail merge, Reference Writing.

MS-Power Point: Working with graphics and creating presentation the easy way, show time, sound effects and animation effects.

### UNIT II

14 Hours

*Concept of spreadsheets, Functions and Formulas of MS Excel, LAN and World Wide Web, Application software installation.*

**Use of Computer Programmes:** Software packages such as MSEXCEL, ORIGIN, CHEM SKETCH, CHEMDRAW, BIOVIADRAW etc. and special emphasis on calculations and chart formations. Problems will be taken preferably from physical chemistry for plotting first and second derivative curves, linear plots etc. Writing the structures of inorganic and organic molecules, writing chemical equations, determining molecular parameters such as bond lengths, bond angles, dihedral angles etc.

**Internet.** Application of Internet for Chemistry with search engines, various types of files like PDF, JPG, RTF and Bitmap. Scanning, OMR, Web camera.

## **COMPUTER PRACTICALS -**

### **MS WORD/POWERPOINT**

1. Page Setup, Save, Open, Close files, Fonts size, Borders & Shading, Alignment, Superscript, Subscript, etc.
2. Changing Indents, formatting paragraph options.
3. Columns, Inserting Symbols, Date, Time, Applying Bullets and Numbering, Page Break and Page Numbers, Word Art
4. Inserting picture, Drawing objects, Numbering and Spell Check, Line Spacing, Drop Cap.
5. Table, Merge Cells, Text Direction, and Paragraph Space before and after.
6. Mail Merge for 5 addresses.
7. Inserting Footnote, Creating and applying styles, Change Case Find and Replace and Autocorrect.
8. Reference Writing and reviewing a document.
9. Creating presentation with show time, sound effects and animation effects for any given topic.

### **MS EXCEL/ORIGIN: Plots and Calculations for physical chemistry problems.**

1. Potentiometric determination of redox potentials.
2. Potentiometric determination of dissociation constants of weak acids.
3. Conductometric titrations of displacement and precipitation reactions.
4. Potentiometric titration of halides in mixtures.
5. Determination of pH of buffer solutions with a pH meter & evaluation of pKa of acids.
6. Determination of maximum wavelength of the sample from transmittance data.
7. Calculate the various statistical information.
8. Energy of activation from rate constant.
9. Beer-lamberts law and molar extensive coefficient.
10. Average molecular weight and molecular weight distribution of the polymer sample.

### **CHEMSKETCH/CHEMDRAW/BIOVIADRAW: structures of inorganic and organic molecules**

1. Structures and diagrams ( Ligands, Indicators)
2. Cannizzaro reaction
3. Benzil-Benzilic acid Rearrangement
4. Preparation of adipic acid from cyclohexanol.
5. Preparation of p-nitrobenzoic acid.
6. Vilsmeier-Haack reaction
7. Bischler-Napieralski reaction
8. Fischer indole synthesis

**REFERENCES:**

## PS 546.3P : ANALYTICAL CHEMISTRY PRACTICALS – I

### Course outcomes:

Student will be able to:

- Analyze the common and rare cations in a mixture by different titration techniques.
- Handle spectrophotometry for various determinations

### Any twelve experiments to be carried out

1. Analysis of Calcium and lead –using EDTA
2. Determination of water in hydrated calcium sulphate by Karl–Fischer titration
3. Estimation of sodium and potassium in soil by flame photometry.
4. Determination of aluminium and magnesium in antacids by EDTA Titration.
5. Determination of mercury by EDTA titration.
6. Determination of iron by spectrophotometry
7. Turbidimetric determination of chloride in brackish waters.
8. Nephelometric determination of sulphate in ground water samples
9. Analysis of  $\text{Na}_2\text{CO}_3$  and  $\text{NaHCO}_3$  in baking soda by acid base titration
10. Assay of Vitamin-C, by iodine titration and by bromination using  $\text{KBrO}_3$
11. Iodometric determination of antimony.
12. Quantitative analysis of mixture of Chloride and iodide; i)iodide volumetrically using  $\text{KIO}_3$ & ii) total halide gravimetrically
13. Analysis of commercial hypochlorite or peroxide solution by iodometric titration
14. Any other experiment of interest

### REFERENCES:

1. Vogel's Text Book of Quantitative Inorganic Analysis, A. I, Vogel, 4<sup>th</sup>Edn, Longman, 1980.
2. Vogel's Text Book of Quantitative Inorganic Analysis, Basset, Denney, Jeffery & Mendham, 5<sup>th</sup>Edn, Livingstone, 1989.
3. Colorimetric Determination of Traces of Metals – E. B. Sandell, 4<sup>th</sup>Edn, John Wiley & Sons, 1978.

## PS 547.3P : ANALYTICAL CHEMISTRY PRACTICALS – II

### Course outcomes:

Student will be able to:

- Have clear understanding of different analytical instruments.
- Apply chromatographic techniques as analytical tool in chemistry.

### Any twelve experiments to be carried out

1. Analysis of Brass-Cu gravimetrically using  $\alpha$ -benzoin oxime and Zn complexometrically
2. Analysis of iron by visual and potentiometric titration using cerium(IV) sulphate.
3. Analysis of Copper-nickel alloy- i). Copper volumetrically using  $\text{KIO}_3$  & ii). nickel gravimetrically using DMG. Stainless steel – Ni gravimetrically using DMG, Fe volumetrically using Ce(IV), Cr volumetrically by persulphate oxidation.
4. Circular paper chromatography-separation of a) iron and nickel; b) copper and nickel c) copper, cadmium and mercury
5. Analysis of copper in ore/alloy by iodometric titration
6. Estimation of Iron in tablets by potentiometric & visual titration using sodium vanadate.
7. Analysis of copper/calcium by PFHS method
8. Separation and determination of chloride and bromide, zinc and magnesium on an ion-exchanger.
9. Estimation of total cation concentration in water by ion-exchange method.
10. Thin layer chromatographic separation of amino acid
11. Determination of copper by potentiometric titration using EDTA.
12. Separation and determination of cadmium and zinc on an anion –exchanger.
13. Separation of Cobalt and Nickel by column chromatography
14. Separation of Nickel, Manganese, Cobalt and Zinc by paper chromatography
15. Estimation of cholesterol by spectrophotometry
16. Determination of urea and uric acid spectrophotometrically
17. Any other experiment of interest

### REFERENCES:

1. Vogel's Text Book of Quantitative Inorganic Analysis, A. I, Vogel, 4<sup>th</sup>Edn, Longman, 1980.
2. Vogel's Text Book of Quantitative Inorganic Analysis, Basset, Denney, Jeffery & Mendham, 5<sup>th</sup>Edn, Livingstone, 1989.
3. Colorimetric Determination of Traces of Metals – E. B. Sandell, 4<sup>th</sup>Edn, John Wiley & Sons, 1978

## PH 548.3P: ANALYTICAL CHEMISTRY PRACTICALS – III

### Course outcomes:

Student will be able to:

- Carry out experiments related to chemical kinetics, Polarimetry, Conductometry and Potentiometry

### A. Electrochemistry:

#### a. Conductometry (At least Three experiments to be carried out)

1. Determination of hydrolysis constants (aniline hydrochloride etc.).
2. Titration of a mixture of acetic acid, monochloro and trichloroacetic acids with NaOH.
3. Determination of concentrations/amounts of sulphuric acid, acetic acid and copper sulphate by conductometric titration with sodium hydroxide.
4. Determination of oxalic acid by conductometric titration with sodium hydroxide.
5. Measurements of the conductance of a weak acid, AcOH and of the strong electrolytes NaOAc, HCl and NaCl and to calculate the ionisation constant of the acid.
6. Determination of pH and  $pK_a$  of a given weak acid at various dilutions.
7. Conductometric titration of the mixture of HCl and  $NH_4Cl$ .
8. Determination of activity coefficient of Zinc ions in 0.002M  $ZnSO_4$ .
9. Any other experiments of interest

#### b. Potentiometry (At least Three experiments are to be carried out)

1. Determination of  $pK_a$  values of maleic acid/malonic and phosphoric acid by potentiometric titration with sodium hydroxide using glass electrode.
2. Determination of acidic and basic dissociation constants and isoelectric point an amino acid.
3. Determination of the potential of an electrochemical cell and mean ionic activity coefficient .
4. pH titration of (a) HCl versus NaOH, (b)  $CuSO_4$  versus NaOH and (c) AcOH versus NaOH and (d) lead nitrate versus potassium chromate.
5. Determination of  $pK_a$  values of functional groups in amino acids using a pH meter.
6. Study of potential-pH diagrams.
7. Determination of activity coefficient of an electrolyte at different molalities.
8. Verification of Tafel equation of hydrogen evolution reaction.
9. Determination of  $pK_a$  values of mono, di and tri-acid base.

### B. Photochemistry (Any Two experiments are to be carried out)

1. Irradiation of a reaction mixture and calculation of the quantum yield.
2. Determination of the quantum yield of chloride in the photohydrolysis of aqueous solution of monochloroacetic acid
3. Photochemical study of decomposition of hydrogen peroxide.
4. Photochemical study of Bleaching of dyes.
5. Photochemical reaction between threonine and ferrous sulphate.

**C. Voltammetry & Polarography** (*Any Three experiments are to be carried out*)

1. Determination of the half-wave potential of Cd(II), Cu(II) & Zn(II) ions in 0.1M solutions.
2. Determination of metal ions individually and in mixtures,
3. Determination of the formula and the stability constant of a lead oxalate.
4. Study of the polarogram of supporting electrolyte with and without dissolved oxygen,
5. Determination of Huckel  $\beta$  value of aromatic hydrocarbon reduction at dropping mercury electrode.

## PO549.3 - OPTICAL METHODS OF ANALYSIS

### Course outcomes:

Student will be able to:

- Understand the basic principles, working and application of atomic absorption spectroscopy
- Will be able to describe the physical principles of photochemistry and explain the methods of fluorescence spectroscopy.
- To learn and analyze the optical properties of solids using various instrumentation techniques.

### UNIT I : ATOMIC EMISSION AND ATOMIC ABSORPTION SPECTROSCOPY

14 Hours

*Basics of emission, absorption, instrumentation and principle of spectrophotometer.*

Introduction, principle, flames and flame spectra, flame temperature, chemical reactions in flame, metallic spectra in flame. Total consumption and premix burners. Effect of organic solvents. Comparative study of the basic components and difference in the instrumental design for atomic absorption and flame photometry. Errors in flame photometry (interferences). Relationship between AAS and FES, advantages over FES. Application of Flame photometry to agricultural, pharmaceutical, inorganic, biochemical samples. Sampling techniques and Analysis of biological samples, fertilizers, food and meat samples, soil and sediments by atomic absorption spectroscopy.

### UNIT II : MOLECULAR LUMINESCENCE

14 Hours

*Phenomenon of fluorescence, phosphorescence, Quantum yield.*

Fluorimetry and phosphorimetry, Introduction, fluorescence and phosphorescence, factors affecting fluorescence and phosphorescence, Jablonski Diagram, internal conversion, intersystem crossing (radiationless processes), quenching. Theory, relationship between intensity of fluorescence and concentration, instrumentation-basic differences in the measurement of fluorescence and phosphorescence, filter fluorimeters, spectrofluorimeters, advantages, limitations and precautions. Selection of excitation wavelength for analysis, reporting fluorescence spectra. Application of fluorimetric analysis of inorganic, organic, pharmaceutical, agricultural, biochemical and biomedical materials. Special fluorimetric and phosphorimetric applications. Chemiluminescence and bioluminescence.

### UNIT III : NEPHELOMETRY, TURBIDIMETRY AND POLARIMETRY

14 Hours

*Phenomenon of optical activity, plane polarised light, instrumentation and working of polarimeter. Comparison of spectrophotometer and colorimeter.*

**Nephelometry and Turbidimetry:** Light scattering, nephelometry and turbidimetry, choice between nephelometry and turbidimetry, turbidimetry and colorimetry, nephelometry and fluorimetry. Theory, effects of concentration, particle size and wavelength on scattering instruments and application of nephelometry and turbidimetry. Turbidimetric titrations.

**Polarimetry:** Instrumentation, optical rotatory dispersion (ORD). Application of optical rotation method in the determination of rate constant - Acid-catalyzed mutarotation of glucose, inversion of cane sugar- Relative strengths of acids. Circular dichroism and its applications.

## SEMESTER IV

### PH 541.4: ORGANIC SYNTHETIC METHODS

#### Course outcomes:

Student will be able to:

- Understand and apply the various reagents in organic synthesis and design organic synthetic reactions.
- Describe the applications of oxidation and reduction techniques in organic synthesis.
- Prefer suitable reagent for important reactions/building appropriate bonds.
- Understand the principles and applications of protecting groups in chemistry.
- .

#### UNIT I:

14 Hours

*Introduction and different types of reductions*

**Reduction Reactions:** Catalytic hydrogenation: Catalysts and solvents employed, reduction of functional groups, mechanisms and stereochemistry of catalytic hydrogenations, Hydrogenolysis and homogenous catalytic hydrogenation. **Metal hydride reduction:** Reduction with  $\text{LiAlH}_4$ ,  $\text{NaBH}_4$ , Stereochemistry of reduction and other functional groups, Functional group transformation during reduction. Reduction with diborane and related reactions. Reduction in Biological systems-NADH, FAD.

**Dissolving metal reductions:** Mechanism of reduction of conjugated systems and carbonyl compounds. Bimolecular reduction of esters, Birch reduction, Wolf-Kishner reduction, Clemmensen reduction, reduction with derivatives of hydrazine. Reduction with arene sulphonyl derivatives of hydrazine, Reaction with di-imide and related compounds.

#### UNIT II

14 Hours

*Introduction to oxidation, different types of oxidative processes.*

**Oxidation Reactions:** Mechanism of oxidation reaction with chromium and manganese salts, peracids, peresters, periodic acids, Lead tetraacetate, ozone, osmium tetroxide, Selenium dioxide and their synthetic importance in functional group transformation.

**Molecular rearrangements:** Mechanism of Wagner-Meerwein, Dienone-Phenol, Pinacol-Pinacolone, Demaynov, Benzil-Benzilic acid, Fries, Wolff, Favorskii, Neber, Benzidine, Baeyer-Villiger, Beckmann, Lossen, Curtius, Schmidt, Stevens, Shapiro, Baker-Venkatraman and Amadori rearrangement.

#### UNIT III

14 Hours

*Introduction of C-C and C=C into the molecules using various reactions,*

**Synthetic Designs:** Carbon skeleton framework, classification of carbon-carbon single and double bonds forming reactions and their use in carbon skeleton ring formation. ring forming and ring cleaving reactions, use of Thorpe condensation, Carbene insertion reaction, Friedel-Crafts reaction, 1,3-dipolar addition and ene reaction in ring formation, Oxidative cleavage of rings and Retro-Diel's Alder reactions.

**Planning of Organic synthesis:** Selection of starting materials and key intermediates during the synthesis. Synthesis of Cubane. Use of Robinson annulations, Dickmann cyclization, Arndt-Eistert homologation and Diel's Alder reaction in organic synthesis. Suzuki coupling, Heck reaction, Negeshi coupling, Sonagashira reaction.

**Functionality:** Synthesis of 6/7-methoxy tetralones, biotin and Pencillin-V with special reference to the introduction of functional groups. Stereochemical consideration and stereo selectivity during organic synthesis.

#### UNIT IV

14 Hours

*Interconversion of functional groups and principle of protection of functional groups*

**General introduction to disconnection approach:** Basic principles and technologies used in disconnection approach. Synthons and Synthetic equivalents. Interconversion of functional groups. One group C-X and two group C-X disconnections. Protecting groups: Principle of protection of hydroxyl, amino, carboxylic acid and carbonyl groups. C-C one and C-C two group disconnection. Multistep synthesis of benzocaine, Phenacetin, 2,4-dichloroacetic acid, 4-Hydroxy-4-methyl pentanone, 2,5-dimethyl-3-hexanone, 2-methyl-6-methoxy indole 3-acetic acid. 6-methylquinoline & 1-phenyl-4-p-methoxyphenyl-1,3-butadiene, Limonene, Danishefsky's pentalenolactone, Benziodarone, nitrofurazone, Warfarin and Juvabione.

8. Modern Organic Chemistry, M K Jain & S C Sharma, 4<sup>th</sup> Edn, Vishal Publishing House, 2011

## PH 542.4: SPECTROSCOPIC METHODS OF ANALYSIS

### Course outcomes:

Student will be able to:

- Learn the fundamental principles of instrumental measurements,
- Develop and understand of the basic principles and application of Electron spin resonance (ESR) spectroscopy, Photoelectron, NQR and Mossbauer spectroscopy for the structural elucidation of compounds.
- Understand the underlying principle of different biophysical methods and will be able to describe the physical principles of photochemistry.

### UNIT I:

14 Hours

*Basics of photo electron, photo electric effect.*

**Photoelectron spectroscopy:** Basic principles, Valence and core binding energies, shifts in energies due to chemical forces, Photoelectron spectra of simple molecules, Auger spectroscopy, measurement techniques. Applications

**Electron Spin Resonance Spectroscopy:** Hyperfine couplings, the 'g' values, factors affecting 'g' values, isotropic and anisotropic hyperfine coupling constants, Zero Field splitting and Kramer's degeneracy. Measurement techniques, Applications to simple inorganic and organic free radicals and to inorganic complexes.

**NQR Spectroscopy:** Quadrupolar nuclei, electric field gradient, nuclear quadrupole coupling constants, energies of quadrupolar transitions, effect of magnetic field. Applications.

**Mössbauer spectroscopy:** Principles, the Mössbauer effect, chemical isomer shifts, quadrupole interactions, measurement techniques and spectrum display, application to the study of  $\text{Fe}^{2+}$  and  $\text{Fe}^{3+}$  compounds,  $\text{Sn}^{2+}$  and  $\text{Sn}^{4+}$  compounds (nature of M-L bond, coordination number and structure), detection of oxidation states and inequivalent Mössbauer atoms.

### UNIT II

14 Hours

*Basics of emission, absorption, instrumentation and principle of spectrophotometer.*

**Atomic emission spectroscopy and atomic absorption spectroscopy-** Introduction, principle, flames and flame spectra, variation of emission intensity with the flame, flame temperature, chemical reactions in flame, metallic spectra in flame, flame background. Total consumption and premix burners, role of temperature on absorption, emission and fluorescence. Effect of organic solvents. Comparative study of the basic components and difference in the instrumental design for atomic absorption, atomic fluorescence and flame photometry. Errors in flame photometry (interferences). Precision and accuracy of AAS and FES. Relationship between AAS and FES, advantages over FES, devices used for the formation of an atomic vapour, Plasma excitation sources, applications, determination of sodium in different samples by flame photometry. Some typical determinations by atomic absorption spectroscopy.

**UNIT III:****14 Hours**

*Phenomenon of fluorescence, phosphorescence, Quantum yield.*

**Molecular Luminescence:** Fluorimetry and phosphorimetry, Introduction, Instrumentation and factors affecting fluorescence and phosphorescence, Jablonski Diagram, internal conversion, intersystem crossing (radiationless processes), quenching. theory, relationship between intensity of fluorescence and concentration, filter fluorimeters, spectrofluorimeters, advantages, limitations and precautions. Selection of excitation wavelength for analysis, reporting fluorescence spectra. Applications of fluorimetric and phosphorimetric analysis.

Basic principles of photoacoustic spectroscopy (PAS), PAS gases and condensed systems, Chemical and surface applications

**UNIT IV****14 Hours**

*Phenomenon of optical activity, plane polarised light, instrumentation and working of polarimeter. Comparison of spectrophotometer and colorimeter.*

**X ray spectroscopy:** Introduction, production of X – rays, interaction of X-rays with matter, X-ray spectrometer, instrumentation, X-ray absorption, Types of absorptions. X-ray emission. Powder and single crystal XRD.

**Nephelometry and Turbidimetry:** Light scattering, nephelometry and turbidimetry, choice between nephelometry and turbidimetry, turbidimetry and colorimetry, nephelometry and fluorometry. Theory, effects of concentration, particle size and wavelength on scattering instruments and application of nephelometry and turbidimetry. Turbidimetric titrations.

**Polarimetry:** Instrumentation, optical rotatory dispersion(ORD). Application of optical rotation method in the determination of rate constant. Acid-catalyzed mutarotation of glucose, inversion of cane sugar- Relative strengths of acids. Circular Dichroism and its applications, deduction of absolute configuration of molecules, octant rule for ketones and cotton effect.

## PH 543.4: CHEMISTRY OF POLYMERS AND NATURAL PRODUCTS

### Course outcomes:

Student will be able to:

- Understand preparation methods, property uses of some industrially important polymers.
- Describe the morphology, structure thermal, physical, and mechanical properties of polymers.
- Gather knowledge about the classification, isolation techniques, understand the various synthetic approaches in Natural Products synthesis structural elucidation of natural products.
- Explain the basics and applications of concerted reactions and pericyclic reactions. Develop an in-depth knowledge of the basics and applications with mechanistic understanding in concerted reactions apply those in the synthesis of organic compounds.

### UNIT I:

14 hours

*Definition of basic terms: Monomers, repeat units, degree of polymerization and Classification of polymers.*

**Polymer synthesis:** Chain growth polymerization and step growth growth-radical-anionic-cationic-ring opening metathesis polymerization (ROMP), Polymerization techniques- Bulk, solution, suspension and emulsion polymerizations, Techniques of preparation of condensation polymers

**Isolation and purification:** Fractional precipitation, partial dissolution, gradient elution and Gel permeation chromatography.

**Structure and Properties:** Molecular weight and size, polydispersity and average molecular weight concept- Number, weight and viscosity average molecular weight concepts. Crystallinity requirements for crystallisability, effect of crystallinity on the properties of polymers. Mechanical properties: Tensile impact, flexural, and impact strength.

### UNIT II :

14 hours

*Empirical formula, Molecular formula and methods to determine the molecular mass of a compound.*

**Determination of molecular weights** - End-group analysis, viscosity, osmometry, and sedimentation method.

**Thermal characterization:** Glass transition temperature, T<sub>g</sub>-transitions and associated properties, factors affecting the temperature and importance of T<sub>g</sub>. Thermogravimetric analysis, and differential scanning calorimetry. Thermal stability, melting and thermal degradation temperatures..

**Polymer Processing Techniques:** Plastics - elastomers - fibres - film casting- compression moulding - injection moulding - blow moulding - extrusion moulding, elastomer properties, vulcanization, reinforcement, fillers, plasticizers and other additives. Fibre making spinning techniques

**UNIT III****14 hours**

*History of Total Synthesis, Natural Product Chemistry.*

**Alkaloids:** Definition, Classification and isolation of alkaloids, general methods of structural determination of alkaloids, detailed study of structure elucidation, stereochemistry, rearrangement, Synthesis and biogenesis of the following alkaloids- Papaverine, Quinine, Morphine, Codeine, Thebaine and Reserpine.

**Terpenoids:** Introduction, classification, isoprene rules, methods of structure determination. Structural elucidation & synthesis of Menthol,  $\alpha$ -Pinene and Abietic acid

**Unit IV****14 Hours**

*Molecular orbital symmetry, Frontier orbitals of ethylene, 1,3-butadiene, 1,3,5-hexatriene and allyl system.*

Classification of pericyclic reactions. Woodward-Hoffmann correlation diagrams. FMO and PMO approach. Electrocyclic reactions, conrotatory and disrotatory motions,  $4n$ ,  $4n+2$  and allyl systems. Cycloaddition reactions: antarafacial and suprafacial additions,  $4n$  and  $4n+2$  systems,  $2+2$  addition of ketenes, 1,3 -dipolar cycloadditions and cheletropic reactions. Sigmatropic rearrangements: suprafacial and antarafacial shifts of H, sigmatropic shifts involving carbon moieties, 3,3- and sigmatropic rearrangements. Claisen and Cope rearrangements. Fluxional tautomerism. Ene reaction.

## PS 544.4P : ANALYTICAL CHEMISTRY PRACTICALS – IV

### Course outcomes:

Student will be able to:

- Clear understanding of different analytical instruments.
- Experimental verification of fundamental concept
- Application of spectroscopic techniques as analytical tool in chemistry

### Any twelve experiments to be carried out

1. Determination of  $\text{NH}_3\text{-N}$ /  $\text{NO}_2\text{-N}$ /  $\text{NO}_3\text{-N}$  in waste waters by spectrophotometry.
2. Determination of calcium in limestone by redox titration.
3. Evaluation of the composition of Fe(II)-phenanthroline complex by spectrophotometry.
4. Evaluation of composition and stability constant of Fe(III)-Tiron complex by Turner and Anderson method.
5. Determination of nitrite in water sample
6. Analysis of Ibuprofen by titrimetry
7. Analysis of paracetamol.
8. Assay of aspirin/caffeine/phenacetin by titrimetry.
9. Spectrophotometric determination of manganese and chromium in a mixture.
10. Determination of inorganic phosphate in blood/urine samples by spectrophotometry.
11. Spectrophotometric determination of titanium using hydrogen peroxide
12. pH-metric determination of soda ash.
13. Spectrophotometric determination of molecular weight of a compound
14. Conductometric determination of total acidity of waste water.
15. Determination of half wave potential of cadmium ion.
16. Polarographic evaluation of stability constant of lead oxalate complex.
17. Determination of Phosphate in domestic waste water by spectrophotometry.
18. Conductometric determination of total alkalinity of waste water/ in terms of calcium carbonate by titrimetry.
19. Any other experiment of interest

2. Vogel's Text Book of Quantitative Inorganic Analysis, Basset, Denney, Jeffery & Mendham, 5<sup>th</sup>Edn, Livingstone, 1989.
3. Photometric Determination of Traces of Metals, E B Onishi, 4<sup>th</sup>Edn, Wiley Blackwell, 1986.

## PS 545.4P : ANALYTICAL CHEMISTRY PRACTICALS – V

### Course outcomes:

Student will be able to:

- Estimate binary mixtures of metallic ions in solution.
- Study structure of the prepared complexes using conductance and magnetic susceptibility measurements, recording the electronic and infrared spectra:

### Inorganic Chemistry Practicals :

1. Colorimetric determination of Zr(IV)
2. Circular paper chromatography-separation of -
  - a) iron and nickel;
  - b) copper and nickel;
  - c) copper, cadmium and mercury
3. Thin layer chromatographic separation of amino acid
4. Separation and determination of cadmium and zinc on an anion- exchanger.
5. Separation of Cobalt and Nickel by column chromatography
6. Separation of Nickel, Manganese, Cobalt and Zinc by paper chromatography
7. Simultaneous colorimetric determination of two metal ions – Mn and Cr.
8. Flame photometric determination of Na, K, Li and Ca individually and in mixtures.
9. Electrogravimetric determination of (a) Cu-Ni alloy and (b) Pb in Type Metal.
10. Solvent extraction of Ni(II) and UO<sub>2</sub>(II).
11. Preparation of any three of the following complexes, checking the purity of the prepared samples by chemical analysis, structural study of the prepared complexes using conductance and magnetic susceptibility measurements, recording the electronic and infrared spectra:
  - a. Chloropentamminecobalt(III) chloride
  - b. Hexamminecobalt(III)chloride.
  - c. Potassium trisoxalatoferate(III)
  - d. Potassium hexathiocyanatochromate(III)
  - e. K<sub>3</sub>Cr(OX)<sub>3</sub>.3H<sub>2</sub>O
12. Determination of composition of complexes:
  - a. Job's method: Fe-phenanthroline complex
  - b. Mole ratio method: Zr-Alizarin red S complex,
  - c. Slope ratio method: Cu ethylenediamine complex,
  - d. Limiting logarithmic method: Uranyl-sulphosalicylic acid complex.
13. Determination of stability constants
  - a. Turner Anderson method : Fe-Tiron system,
  - b. Bejrrum's method : Cu – sulphosalicylic acid system,
  - c. Polarographic method : Cu-glycinate or Pb -oxalate system.

**PH 546.4      PROJECT WORK**

## PS 547.4: APPLIED ANALYSIS AND AUTOMATION

### Course outcomes:

Student will be able to:

- To be able to determine the reaction rates
- An ability to ensure the quality of production processes within the field of chemistry so as to guarantee effective output.
- Be able to describe the chemical and biochemical properties of major food constituents, poisonous materials and have an overview of the automated systems.

### UNIT I:

14 Hours

*Reaction stoichiometry, rate of a reaction, empirical rate equations, catalysis and inhibition*

Analytical uses of reaction rates. Methods to determine the order of a reaction, isolation, half life, differential, integral methods. Rate laws-First and second order reactions, relative rates of reactions. Analytical utility of first or pseudo first order reactions. Determination of reaction rates, conductometric, polarographic, potentiometric, spectrophotometric methods. Types of Kinetic methods-differential methods, integral methods. Multicomponent analysis, logarithmic extrapolation method. Catalyzed reactions-measurement methods for catalyzed reactions, micro determination of inorganic species like iodide, selenium, and cobalt in complex materials. Enzyme-catalyzed reactions- characteristics of enzymes, use of enzymes for catalysis. Enzymes specificity, enzyme activity and enzyme nomenclature. Determination of enzymes – LDH, GOT and GPT.

### UNIT II:

14 Hours

*Advantages and disadvantages of automated systems, types of dispersion.*

An overview of automated systems, Definition- Distinction between automatic and automated systems. Types of automated techniques. Discrete techniques, Segmented flow methods and basic equipment, special techniques and devices. Applications BUN analysers, automatic glucose analyzer, ammonia in water analyzer. COD, BOD analyzers. Flow injection analysis, principles, factors affecting dispersion. Flow injection titrations. Discrete methods. Centrifugal fast scan analyzer, automatic elemental analyzer. Comparison of discrete and non-discrete methods.

Introduction to continuous flow reactors in chemical, biological and food industries. Advantages and disadvantages of continuous flow chemistry.

**Forensic analysis:** General discussion of poisons with special reference to mode of action of cyanide, organophosphates and snake venom. Estimation of poisonous materials- lead, mercury and arsenic in biological materials.

**Food Analysis:** General methods for the determination of moisture, ash, crude protein, fat, crude fibre, carbohydrates, calcium, potassium, sodium and phosphates. **Dairy products-** composition of milk and milk products. Alcohols test, fermentation, dye reduction, Methylene blue and Resazurin tests. Analysis of fat content, minerals in milk and butter. Milk adulteration.

Food adulteration detection and analysis at home in commonly used kitchen ingredients.

**UNIT III:**

**14 Hours**

*An introduction to quality control and quality assurance- basic concepts.*

**Quality Control and Quality Assurance** : Quality assurance, aspects of specification and tolerance, quality acceptance, sampling, reliability, cost aspects of quality decisions. Quality control in raw materials, production (in process), finished product. Current trends in quality control. ISO 9001, ISO 14001 and ISO/IEC 17025 series. Laws related to quality control. Case studies of quality control in various industries such as polymers, fertilizers, agrochemicals, petrochemicals, dyes and pharmaceuticals.

## PS 548.4 : RADIATION AND PHOTOCHEMISTRY

### Course outcomes:

Student will be able to:

- Demonstrate a systematic understanding of the key aspects of nuclear chemistry and their analytical applications
- Acquire the knowledge of nucleus, nuclear reaction, radioactive techniques and application of radioisotopes.
- Describe the methods of measurements and kinetics of photochemical reactions
- Discuss the principle of absorption and emission of radiation and explain the mechanism of Jablonski diagram

### UNIT - I :

14 Hours

*Definition, Natural and artificial radioactivity, characteristics of  $\alpha$ ,  $\beta$  and  $\gamma$  rays.*

**Nuclear structure and stability:** Nuclear properties - nuclear forces, mass defect and binding energy. Nuclear stability-Liquid drop, shell and collective models.

**Radioactivity and Nuclear Decay:** Decay modes of natural and artificial nuclides- Determination of half life, growth kinetics. Conditions of equilibrium.

**Radiation Detection and Measurement:** Experimental techniques in the assay of radioactive isotopes. Radiation Detectors-ionisation chambers, proportional and Geiger-Muller, scintillation and semiconductor radiation detectors (NaI-Tl and Ge(Li), HPGe solid state detectors). Liquid scintillators and multichannel analysers.

**Nuclear Reactions, Energy and Nuclear Power reactors:** Nuclear fission and fusion. Types of nuclear power reactors, basic features and components of a nuclear power reactor. An introduction to breeder reactors.

### UNIT – II

14 Hours

*Health and Safety Aspects: Biological effects of radiation, Hazards in radiochemical work. Radiation protection, permissible exposure doses. Radioactive waste management.*

**Radioisotopes:** Definition of curie and related calculations. Production of radioisotopes and labelled compounds by bombardment. Radiochemical separation techniques- carriers, solvent extraction and ion-exchange methods. Szilard-Chalmer process. Physico-chemical and analytical applications-isotope dilution method, activation analysis, PGNA, neutron absorptiometry, radioimmuno assay, radiometric titration, determination of the age of the aquatic life and age of the minerals and C-14 dating. Medical, agricultural and industrial applications of isotopes.

**Radiation Chemistry:** Difference between radiation and photochemistry. Radiation sources, units (LET, Rad, Roentgen and G-value), radiation dose and radiation chemical yield. Chemical Dosimetry-Fricke and Ceric sulphate dosimeters. Radiation chemistry of water. A brief introduction to radiolysis of gases, liquids and solids. Techniques for study of transient species- Pulse radiolysis.

**UNIT- III:****14 Hours***Photochemical reactions, Definition of Quantum yield*

Introduction to photochemistry, determinations of Quantum yield, experimental methods in photochemistry, Actinometry. Electronic energy states of atoms and molecules -rules for transition between two energy states. Life time of excited electronic states, Frank- Condon principle. Absorption and emission spectra- effect of solute solvent interactions on electronic spectra-spectral shifts. Physicochemical properties of electronically excited molecules-excited state dipole moments, acidity constants. Study of excited states by flash photolysis and laser beam experiments.
